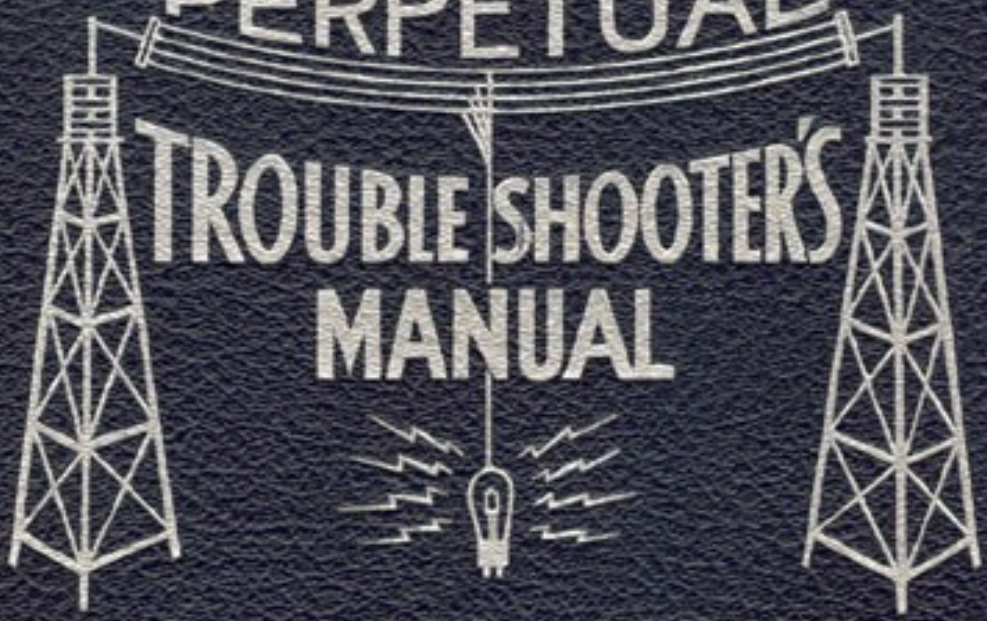
PERPETUAL TROUBLE SHOOTER'S MANUAL



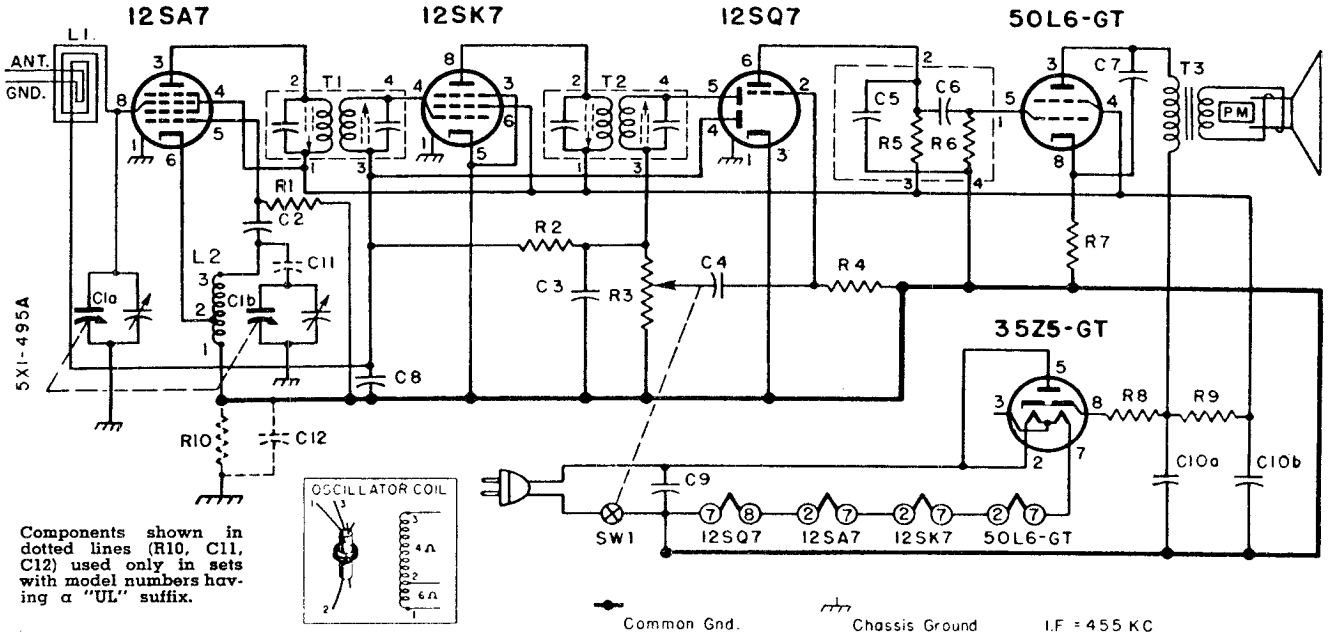
JOHN F. RIDER

Rider's Perpetual Trouble Shooter's Manual

Volume 20

MODELS 5X11, 5X12, 5X13, 5X14; Ch. 5X1

If external antenna and ground is required, connect to wire leads on loop antenna. Caution: Do not connect ground wire directly to chassis.

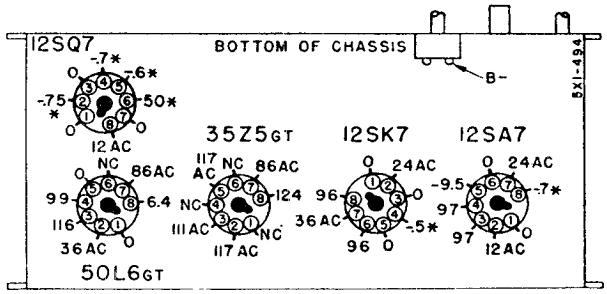


Components shown in dotted lines (R10, C11, C12) used only in sets with model numbers having a "UL" suffix.

NOTE: Common Gnd. becomes chassis ground in sets with model numbers ending in "N".

VOLTAGE DATA

- All readings made between tube socket terminals and B minus (terminal of On-Off switch).
- Dial turned to low frequency end; volume control at minimum.
- Measured on 117 Volts AC line. When measured from DC line, voltages may be slightly lower.
- Voltages measured with Vacuum Tube Voltmeter. Readings taken with a 1,000 ohm per volt meter will be approximately the same except for those marked with an asterisk * in the voltage chart; these readings will either be lower or practically zero.



* If taken with a 1000 ohm-per-volt meter, readings will be either lower or practically zero.

RESISTORS

MODELS 5X11, 5X12,
5X13, 5X14; Ch. 5X1

ALIGNMENT PROCEDURE

- Connect output meter across voice coil.
- Turn receiver volume control full on.
- Use an isolation transformer if available, otherwise connect a .1 mfd. condenser in series with low side of signal generator and attach to B minus (terminal of On-Off switch).

  Caution: Do not connect a ground wire directly to chassis.
- Use lowest output setting of signal generator capable of producing adequate output meter indication and then proceed as outlined in chart below.
- Repeat adjustments to insure good results.

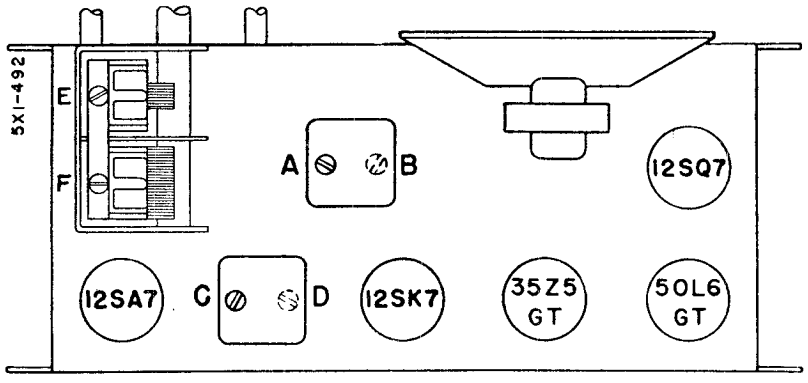
NOTE

- Use a non-metallic alignment tool for IF transformers.

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Trimmer Description	Trimmer Designation	Type of Adjustment
1	250 mmfd. condenser	Tuning condenser Antenna stator	455 KC	Gang fully open	2nd IF 1st IF	A, B C, D	Maximum Output
2	250 mmfd. condenser	Tuning condenser Antenna stator	1620 KC	Gang fully open	Oscillator (on gang)	E	Maximum Output
3	Loop of several turns of wire (or place generator lead close to receiver loop for adequate signal)	No physical connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna (on gang)	F	Maximum Output
4	Mount and set dial pointer as shown in Pointer Setting and Dial Cord Stringing Diagram.						

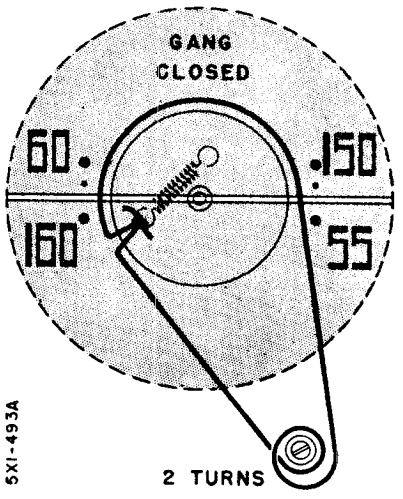
NOTE: Adjustments B and D are made from underside of chassis.

TUBE AND TRIMMER LOCATION



Adjustments B and D are made from underside of chassis.

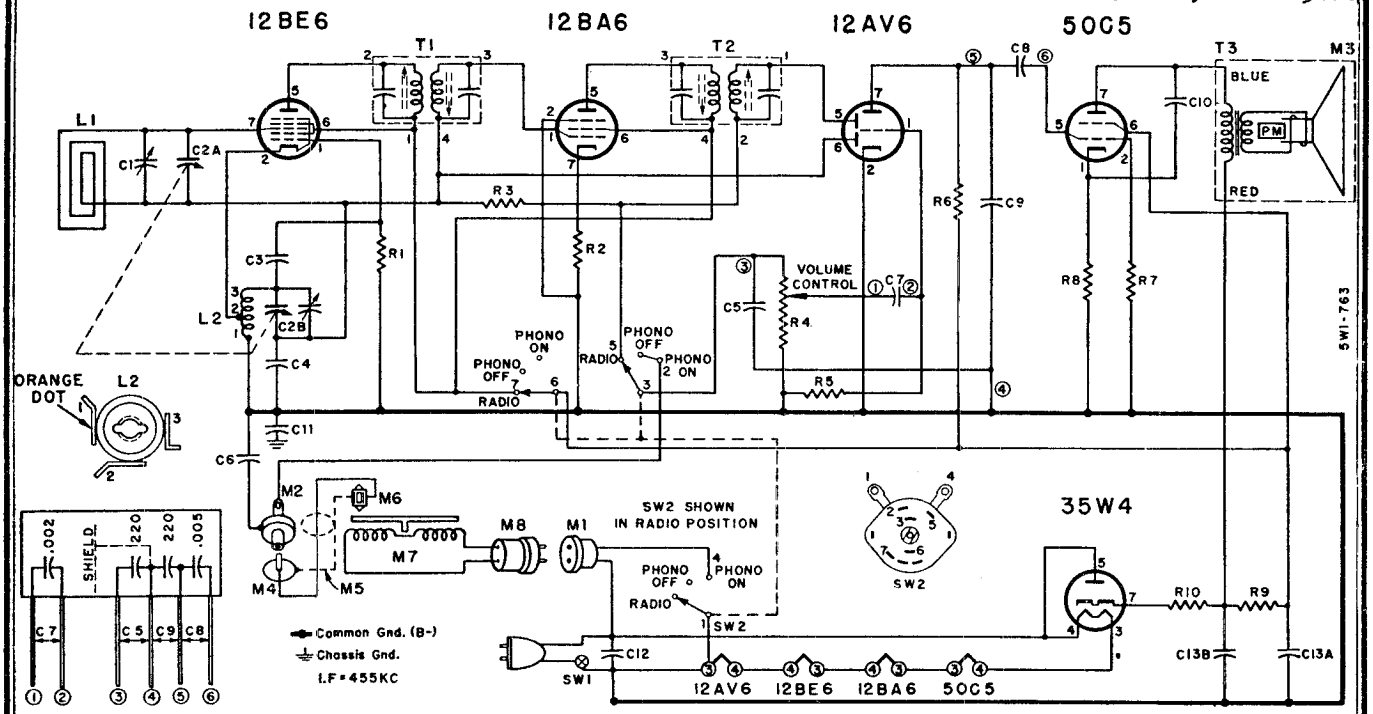
POINTER SETTING AND DIAL CORD STRINGING



With gang fully closed, set pointer in horizontal position.

©John F. Rider

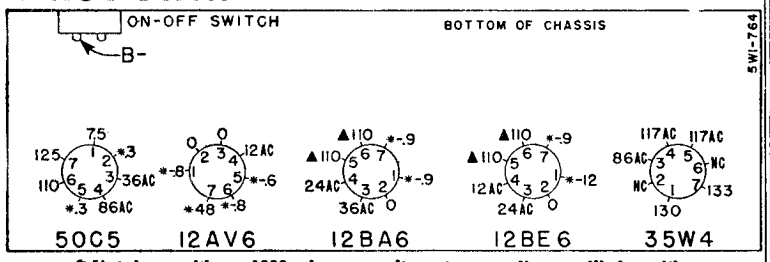
MODELS 5W11, 5W12; Ch. 5W1



For models ending in "UL", a .05 mfd, 400 V, condenser is wired between terminal 3 of L2 and stator of C2B.

VOLTAGE DATA

- All readings made between tube socket terminals and B minus (terminal of On-Off switch).
- Switch in "Radio" position.
- Measured on 117 Volt AC line.
- Volume control minimum; dial turned to low frequency end.
- Voltages measured with Vacuum Tube Voltmeter. Readings taken with a 1000 ohm-per-volt meter will be approximately the same except for those marked with an asterisk * in the voltage chart; these readings will either be lower or practically zero.



* If taken with a 1000 ohm-per-volt meter, readings will be either lower or practically zero.

▲ On "Phono" these voltages will be zero. All other DC readings may be slightly higher.

MODELS 5W11,
5W12; Ch. 5W1

ALIGNMENT PROCEDURE

- Turn receiver volume control full on (fully clockwise).
- Loop antenna must be connected and placed in the same relative position to the chassis as when in cabinet.
- Use an isolation transformer if available, otherwise connect a .1 mfd. condenser in series with low side of signal generator and attach to B minus of chassis (terminal of On-Off Switch).

Caution: Do not connect a ground wire directly to chassis.

- Connect output meter across speaker voice coil.
- Use lowest output setting of signal generator capable of producing adequate output meter indication and proceed in the following sequence.
- Repeat adjustments to insure good results.

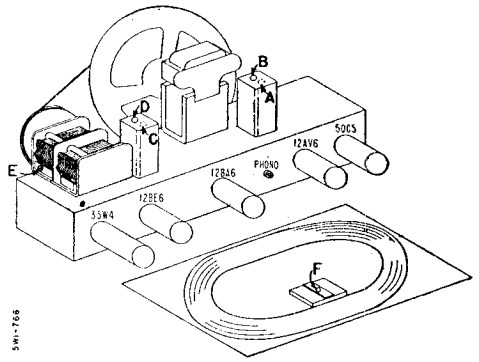
NOTE

- Use a non-metallic alignment tool for IF transformers.

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Trimmer Description	Trimmer Designation	Type of Adjustment
1	250 mmfd. condenser	Tuning condenser, antenna stator	455 KC	Gang fully open	2nd IF 1st IF	*A, B *C, D	Maximum output
2	250 mmfd. condenser	Tuning condenser, antenna stator	1620 KC	Gang fully open	Oscillator	E	Maximum output
†Mount dial pointer. Set pointer to horizontal position with tuning condenser tuned to 1400 KC generator signal (see illustration below). Rotate the tuning condenser until the pointer is in a vertical position (900 KC), then slip chassis in cabinet, carefully guiding the pointer so that it locates between the dial escutcheon and the cabinet. Install loop antenna and chassis mounting bolts.							
3	Loop of several turns of wire, or place generator lead close to receiver loop for adequate signal.	No actual connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna	F (see note below)	Maximum output

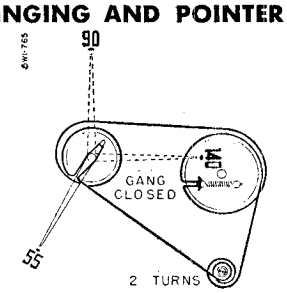
* Trimmer adjustments A and C made from the underside of the chassis.
†In later sets (with two piece escutcheon spring #19A60), the pointer and escutcheon can be mounted after installing the chassis in cabinet. Proceed as follows: Set pointer to horizontal position with gang tuned to 1400 KC signal (see illustration below). Place escutcheon on cabinet. With long nose pliers slip the hairpin ends of the escutcheon mounting springs in holes of escutcheon tabs.
NOTE: Antenna Trimmer "F" must be aligned after chassis and loop are mounted in cabinet.

TUBE AND TRIMMER LOCATION



Adjustments A and C made from underside of chassis.

DIAL STRINGING AND POINTER SETTING



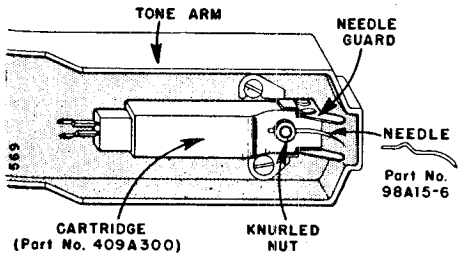
Dial stringing and pointer with solid lines shown with gang closed. Dashed line pointer positions (1400 KC and 900 KC) shown when tuning condenser is tuned to generator signal.

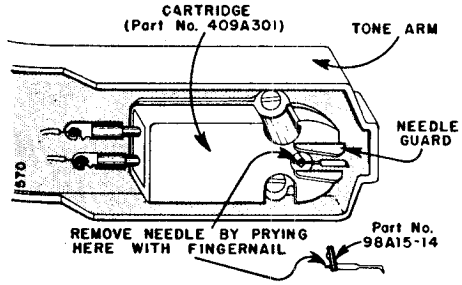
RECORD CHANGER SERVICE DATA

Check model label on underside of record changer for model number. Complete service information and parts list for the RC400 record changer is contained in the RC400 Record Changer Service Manual (form number S275).

Cartridge and Needle

As shown in the illustrations, alternate cartridges may be used. Cartridges are interchangeable when complete with needle.





© John F. Rider

Antenna

This set has a built-in "Line Cord FM Antenna" with lead wire brought out through back of chassis to left side antenna terminal (facing back of set).

Instructions for connecting external FM antenna (300 ohm) or external AM antenna are on cabinet back. **Caution:** Do not use a ground.

Hum on FM Only in Sets with Early Ratio Detector

If hum is experienced on FM position in sets having the early ratio detector circuit (see schematic), replace the 12AL5 ratio detector tube. If hum still remains, disconnect the ground tie point from junction of resistors R18 and R19 (point "Y"), then connect the ground tie point to the junction of resistor R19 and negative of condenser C25. Complete schematic shows the modified (late) circuit.

FM Service

Much of FM service is similar to the usual service necessary for AM receivers such as voltage analysis, parts replacement, etc. The chief differences arise because of the considerably higher frequencies used in FM operation, and because of the different type of second detector needed in FM. For a complete discussion of the FM Ratio Detector circuit used in this chassis, see the 9A1 Service Manual, or any text book.

The higher frequencies involved means that more care must be exercised in location and length of leads. Leads tend to act as small inductances or capacities at high frequency and hence may appreciably alter the electrical characteristics of a circuit. For this reason, ground connections should always be maintained as originally made in the set. Also note that in certain circuits, the type by-pass condenser used is critical at the high FM frequencies. When replacing condensers it is important that they be replaced with condensers of identical capacity values, tolerances, temperature coefficients and construction. For example: C11 is a 2 mmfd ± .25 mmfd, — .00075 temperature coefficient, ceramic capacitor. If defective it should be replaced with a 2 mmfd ± .25 mmfd, — .00075 temperature coefficient, ceramic capacitor.

FM Alignment Equipment

This chassis should be aligned only with an AM signal generator and a vacuum tube voltmeter. Any standard brand vacuum tube voltmeter with a DC scale of not over 5 volts is suitable. A 3-volt zero center scale is desirable. A signal generator with a frequency range up to 110 MC. is desirable. It is possible however, to align the receiver with a signal generator going to 20 or 30 megacycles, by using the harmonics of these lower frequencies. To do this merely set the signal generator dial as follows and align exactly as explained in the alignment instructions.

Where alignment chart specifies 109 MC, 104 MC, 90 MC or 87 MC, set signal generator to highest available frequency shown in the column under that frequency (given in megacycles).

109.	104.	90.	87.
54.50	52.	45.	43.5
36.33	34.66	30.	29.
27.25	26.	22.5	21.75
21.80	20.8	18.	17.4
18.17	17.33	15.	14.5

Signal generators which do not tune to 110 MC or whose harmonics are not strong enough, cannot be used for FM alignment.

IMPORTANT PRELIMINARY ALIGNMENT STEPS

Under normal operating conditions or use, misalignment of RF or IF circuits with age will be slight. Lack of sensitivity and poor tone quality may be due to causes other than alignment. Do not attempt to realign the receiver until all other possible causes have first been thoroughly investigated.

In FM alignment, it is essential that every step be followed. Especially important is picking the center of the IF curve (step 4 in the FM-IF alignment instructions). During this portion of the alignment it is necessary to tune the signal generator very carefully; it may necessitate having to estimate the dial readings to a tenth of a division.

If complete alignment is necessary, it is essential that proper sequence be followed as tabulated in the alignment chart. However, if only the AM band or a portion of the FM circuit are to be aligned, proceed from that point on the chart being sure to follow all remaining steps.

Adjustments made to FM-IF's at 10.7 MC, will require realignment of AM-IF slug adjustments.

Use an isolation transformer if available, otherwise connect a .1 mfd. condenser in series with low side of signal generator and connect to chassis. Caution: Do not connect a ground wire directly to chassis.

Be sure both the set and the signal generator are thoroughly warmed up before starting alignment.

FM I.F. AND RATIO DETECTOR ALIGNMENT

- Keep output indicator leads well separated from signal generator leads and chassis wiring.
- Band switch in FM position (fully to the left).
- While peaking IF's, keep reducing signal generator output so VTVM reading is approximately +1.5 volts DC with exception of Step #5.
- To avoid splitting the slotted head of iron core tuning slugs in the IF transformers, use a non-metallic alignment tool with a ⅛" wide screwdriver blade. Do not exert undue pressure as threads of slugs may strip.
- Speaker must be connected during alignment.
- Disconnect FM antenna at antenna terminal strip.

Before proceeding, be sure to follow instructions above and under "Important Preliminary Alignment Steps."

	Connect Signal Generator	Generator Frequency	Receiver Dial Setting	Output Indicator and Special Connections	Adjust as Follows (very carefully)
1	Thru .001 cond. to 2nd IF grid (pin #1 of 12BA6 2nd IF)	‡10.7 MC	Tuning gang wide open	Connect VTVM (DC probe) to point "W", common to chassis. (See Fig. 7B.)	"A" (ratio detector primary) for maximum reading on VTVM.
2	**Thru .001 cond. to 1st IF grid (pin #1 of 12BA6 1st IF)	"	"	" "	Iron cores "B" and "C" (2nd IF trans.) for maximum reading on VTVM.
3	To FM antenna terminals thru 20 ohm carbon resistor in series with each generator lead.	"	"	" "	"D" and "E" (1st IF) for maximum on VTVM. (Keep reducing generator output to keep VTVM at 1.5 volts)
4	"	a. Reduce output of signal generator until VTVM reads **exactly** +1.5 volts DC. b. Tune generator frequency above 10.7 MC until VTVM reads **exactly** +1.0 volt. Note **exact generator frequency. Extreme care in reading this is essential.** c. Tune generator frequency below 10.7 MC until VTVM reads **exactly** +1.0 volt. Note **exact generator frequency. Extreme care in reading this is essential.** d. Add generator frequency in step c to generator frequency in step b and divide by 2. The result is the center frequency of the IF curve to be used in step 5. See example on next page. e. Tune generator frequency above and below 10.7 MC and note voltage reading on VTVM at different frequency points until you have a good impression of the shape of the selectivity curve. If you have two peaks as in Figures 5 or 6, note readings (voltage) of both peaks. If one peak is over 20% higher than the other one, it will be necessary to realign IF's. A selectivity curve that would require realignment is illustrated by Figure 6.			
5	"	Center of IF selectivity curve per step 4d above. See "EXAMPLE" on next page.	Tuning gang wide open	Connect VTVM (DC probe) to point "X", common to point "Y" (junction of R18 and R19) (See Fig. 7B.)	Iron core "F" (ratio detector secondary) for zero voltage reading on VTVM. (The correct zero point is located between a positive and a negative maximum.)

If any adjustments were very far off, it is desirable to repeat steps 3, 4 and 5.

**Do not feed I.F. signal into converter grid as this will cause mis-alignment.
‡Signal may be unmodulated or 400 cycle AM modulated.

Note: Trimmer adjustments A, B, and D made from underside of chassis.

MODELS 6Q11, 6Q12, 6Q13, 6Q14; Ch. 6Q1

SETTING SIGNAL GENERATOR TO CENTER OF I.F. SELECTIVITY CURVE

CAUTION: Due to the difficulty of setting a signal generator to the accuracy required by this operation, extreme care must be exercised in making each setting. Otherwise, improper alignment of the ratio detector and consequent audio distortion will result.

EXAMPLE: (See Figures 1 and 2)

Voltage reading in Step 4a is + 1.5 volts.

Generator frequency on low side of 10.7 MC for a reading of + 1 volt DC = 10.640 MC.

Generator frequency on high side of 10.7 MC for a reading of + 1 volt DC = 10.800 MC.

Center frequency is obtained by adding 10.640 and 10.800, then dividing by 2. For these readings it will be 10.72 MC.

Set generator frequency to 10.72 MC as this is center of selectivity curve as shown in Figure 2.

Note: Numerical vernier dial readings may be used instead of MC.

FM RF ALIGNMENT PROCEDURE

Step	Connections	Generator Frequency	Receiver Gang or Dial Setting	Adjust as follows (very carefully)
1	Connect Generator: To FM antenna terminals thru 20 ohm carbon resistor in series with each generator lead. Connect VTVM: DC probe to point "W"; common to chassis.	†109 MC	Gang fully open	M (oscillator) and N (antenna) for maximum. It is advisable to adjust generator output so VTVM readings do not exceed approximately + 1.5 V. DC while peaking.
2		†87 MC	Tune in Signal. (Gang should be closed or almost closed.)	If signals in steps 1 and 2 will not tune in at gang tuning extremes (±0.5 MC), it will be necessary to spread or squeeze oscillator coil turns and then repeat steps 1 and 2 until correct results are obtained.
3		†104 MC	Tune in Signal	Readjust N for maximum VTVM reading, while rocking gang. If trimmer does not peak, it will be necessary to squeeze or spread turns of FM antenna coil. Check tracking at 90 MC. Slide chassis into cabinet and check calibration. Calibration error should not exceed ±0.5 MC. If necessary, repeat steps 1, 2, 3 until correct results are obtained.

† Signal may be unmodulated or 400 cycle AM modulated. If your signal generator does not reach this frequency, use harmonics as dsecribed in "FM Alignment Equipment."

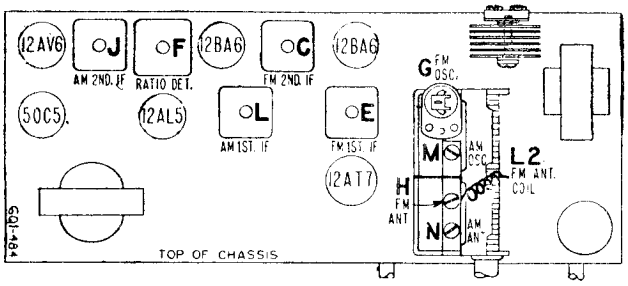

Fig. 7A. Trimmer Location, Top

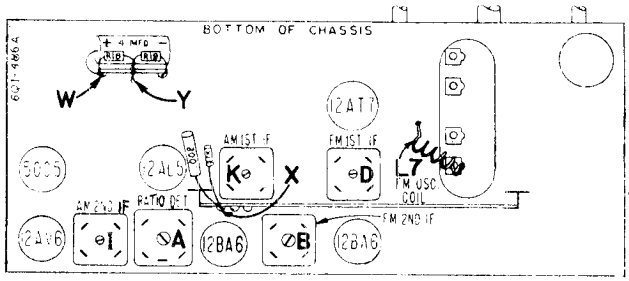

Fig. 7B. Trimmer Location, Bottom

AM ALIGNMENT PROCEDURE

- Use regular output meter connected across speaker voice coil.
- Turn receiver Volume Control fully clockwise.
- AM loop antenna must be connected, FM antenna disconnected.
- Use lowest output setting of signal generator that gives a satisfactory reading on meter.

	Connect Signal Generator	Dummy Antenna Between Radio and Signal Generator	Signal Generator Frequency	Receiver Dial Setting	Adj. Trimmers in Following Order to Max.
	Set Band Switch to Broadcast Position and be sure to follow instructions under heading "Important Preliminary Alignment Steps." Loop antenna must be connected, FM antenna disconnected.				
1	Gang condenser AM antenna stator	250 mmfd.	455 KC	Tuning gang wide open	I, J (2nd IF) K, L (1st IF)
2	"	"	1620 KC	"	M (oscillator)
3	Place generator lead close to loop of set to obtain adequate signal. No actual connection (signal by radiation).		1400 KC	Tune in signal	N (antenna)

Slide chassis in cabinet for checking dial calibration.
Note: Trimmer adjustments I and K made from underside of chassis.

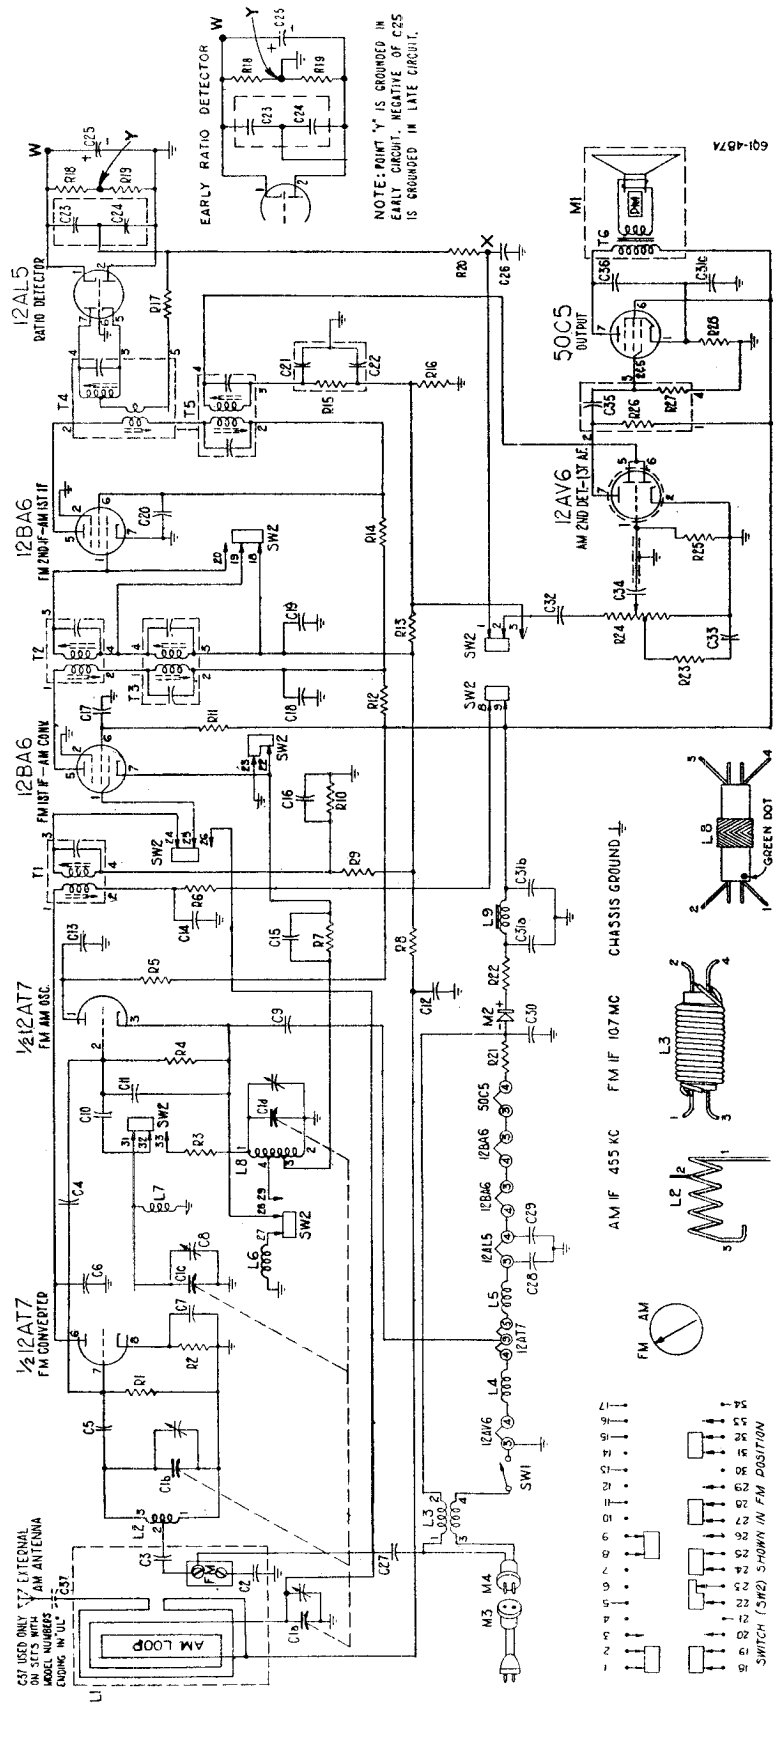
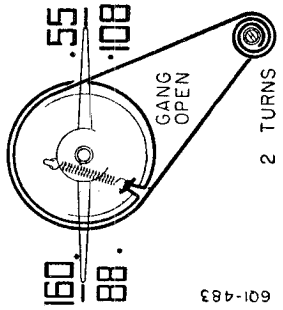
6Q13, 6Q14; Ch. 6Q1

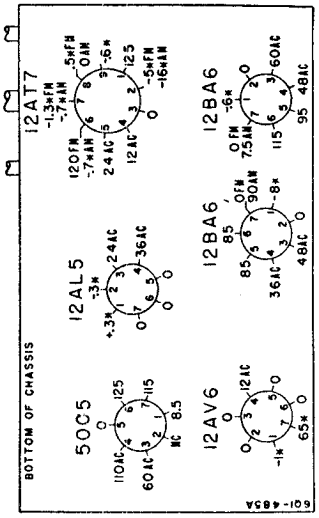




POINTER SETTING AND DIAL STRINGING

With gang open, pointer should be as shown in stringing diagram. If not, move it by hand while keeping the gang open.

VOLTAGE DATA

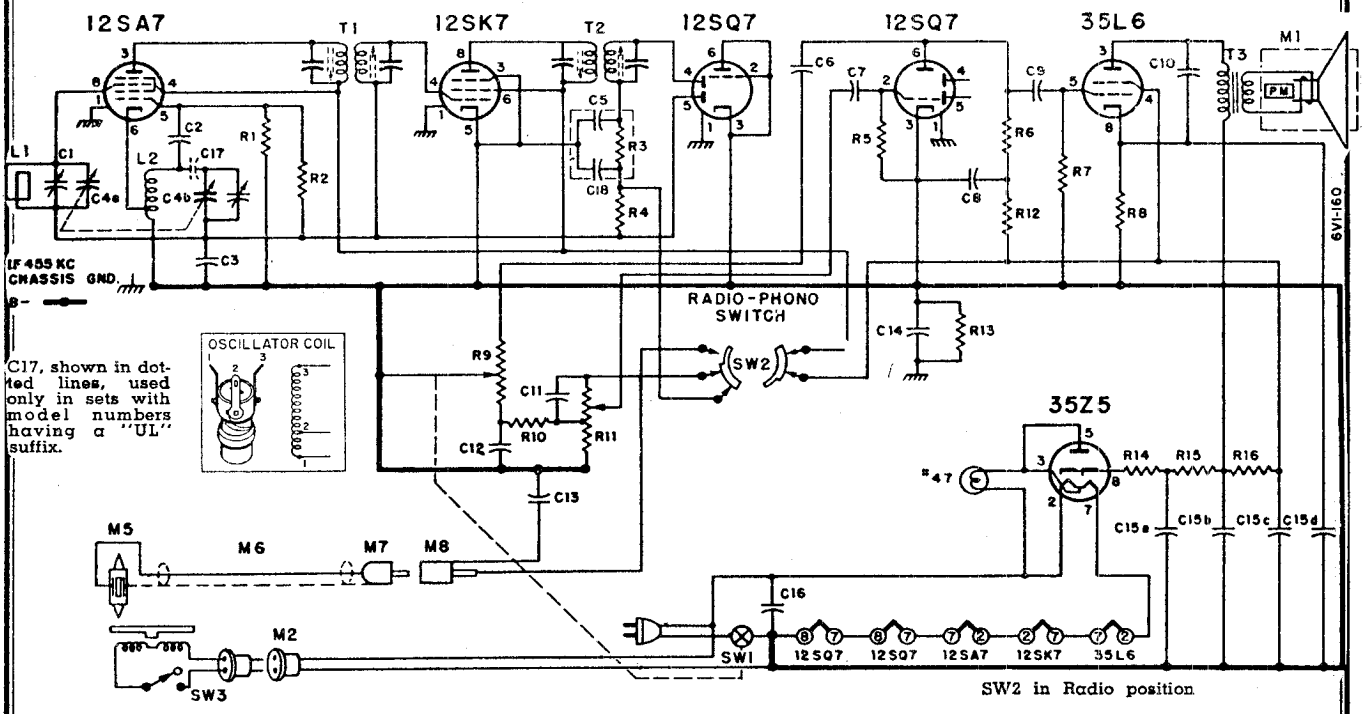


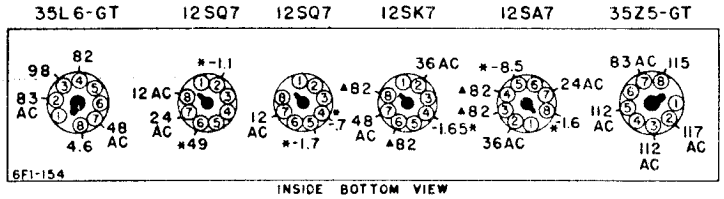
* Lower or zero if taken with 1000 ohm-per-volt meter.

- Voltages taken between terminals and chassis ground, except for 12AL5 terminals #1 and #2, which are taken to point "Y".
- Band switch in FM position unless otherwise indicated.
- Measured on 117 Volt AC line.
- Volume control minimum; dial at low frequency end.
- Voltages measured with vacuum tube voltmeter. Asterisk * indicates much lower or zero readings if measured with 1000 ohm-per-volt meter.

©John F. Rider

MODELS 6V11, 6V12; Ch. 6V1





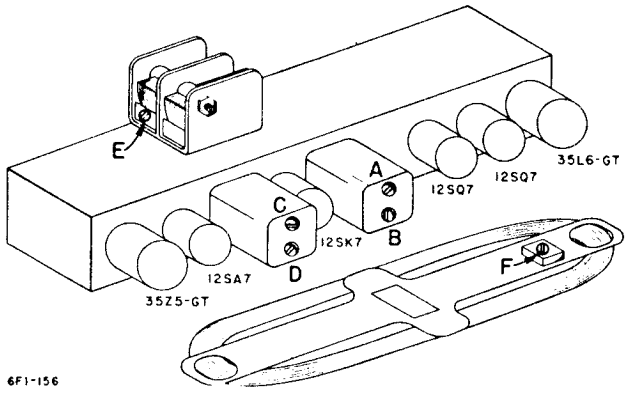
*** If taken with a 1000 ohm-per-volt meter, readings will be either lower or practically zero.**

▲ On "Phono" these voltages will be zero. All other DC readings may be slightly higher.

VOLTAGE DATA

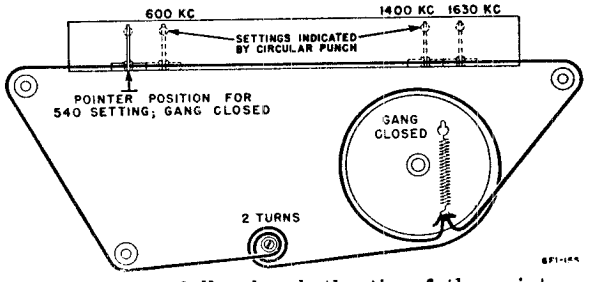
- All readings made between tube socket terminals and B minus (terminal of On-Off switch).
- Switch in "Radio" position.
- Measured on 117 Volt AC line.
- Volume control minimum; dial turned to low frequency end.
- Voltages measured with Vacuum Tube Voltmeter. Readings taken with a 1000 ohm-per-volt meter will be approximately the same except for those marked with an asterisk * in the voltage chart; these readings will either be lower or practically zero.

TUBE AND TRIMMER LOCATION



Adjustments B and D made from underside of chassis.

DIAL STRINGING AND POINTER SETTING



With the gang fully closed, the tip of the pointer clip should be in line with the 1/16" circular punch at the extreme left end of the dial background.

©John F. Rider

MODELS 6V11, 6V12; Ch. 6V1

ALIGNMENT PROCEDURE

- Check pointer position. With tuning gang closed, the tip of the pointer clip should be over the 1/16" circular punch at the extreme left end of the dial background (see stringing diagram).
- Connect output meter across voice coil.
- Turn receiver volume control full on; set tone control fully clockwise.
- Loop antenna must be connected and placed in the same relative position to the chassis as when in cabinet.
- Use an isolation transformer if available, otherwise connect a .1 mfd. condenser in series with low side of signal generator and attach to B minus of chassis.
- Use lowest output setting of signal generator capable of producing adequate output meter indication and proceed in the following sequence.
- Repeat adjustments to insure good results.

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Trimmer Description	Trimmer Designation	Type of Adjustment
1	250 mmfd. condenser	Tuning condenser, antenna stator	455 KC	Gang fully open	2nd IF 1st IF	A, B* C, D*	Maximum output
2	250 mmfd. condenser	Tuning condenser, antenna stator	1620 KC	Gang fully open	Oscillator	E	Maximum output
3	Loop of several turns of wire, or place generator lead close to receiver loop for adequate signal.	No physical connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna	F (see note below)	Maximum output

* Trimmer adjustments B and D made from the underside of the chassis.

NOTE: Antenna Trimmer "F" must be aligned after chassis and loop are mounted in cabinet. Loop trimmer adjustment is located at the rear of the cabinet.

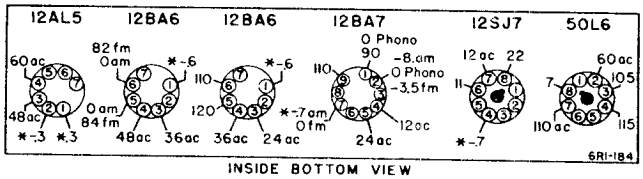
FM SERVICE

Much of FM service is similar to the usual service necessary for AM receivers such as voltage analysis, parts replacement, etc. The chief differences arise because of the considerably higher frequencies used in FM operation, and because of the different type of second detector needed in FM.

For a complete discussion of the FM Ratio Detector circuit used in this chassis, see Page 2 of the 9A1 Service Manual.

The higher frequencies involved means that more care must be exercised in location and length of leads. Leads tend to act as small inductances or capacities at high frequency and hence may appreciably alter the electrical characteristics of a circuit. For this reason, ground connections should always be maintained as originally made in the set. Also note that in certain circuits, the type by-pass condenser used is critical at the high FM frequencies. When replacing condensers it is important that they be replaced with condensers of identical capacity values, tolerances, temperature coefficients and construction. For example: C19 is a 100 mmfd ± 5%, — .00075 temperature coefficient, ceramic capacitor. If defective it should be replaced with a 100 mmfd ± 5%, — .00075 temperature coefficient, ceramic capacitor.

VOLTAGE DATA



* If taken with a 1000 ohm-per-volt meter, readings will be lower or zero.

- Voltages read between socket terminals and B minus (terminal of Off-On switch).
- Band switch in FM position unless otherwise indicated in chart.
- Measured on 117 Volt AC line.
- Volume control minimum; dial turned to low frequency end.
- Voltages measured with Vacuum Tube Voltmeter. Readings taken with a 100 ohm-per-volt meter will be approximately the same except for those marked with an asterisk * in the voltage chart; these readings will either be lower or zero.

SETTING SIGNAL GENERATOR TO CENTER OF I.F. SELECTIVITY CURVE

CAUTION: Due to the difficulty of setting a signal generator to the accuracy required by this operation, extreme care must be exercised in making each setting. Otherwise, improper alignment of the ratio detector and consequent audio distortion will result.

EXAMPLE: (See Figures 1 and 2)

Voltage reading in Step 4a is + 1.5 volts.

Generator frequency on low side of 10.7 MC for a reading of + 1 volt DC = 10.640 MC.

Generator frequency on high side of 10.7 MC for a reading of + 1 volt DC = 10.800 MC.

Center frequency is obtained by adding 10.640 and 10.800, then dividing by 2. For these readings it will be 10.72 MC.

Set generator frequency to 10.72 MC as this is center of selectivity curve as shown in Figure 2..

Note: Numerical vernier dial readings may be used instead of MC.

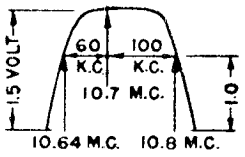

Fig. 1

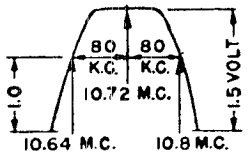

Fig. 2

TYPICAL SELECTIVITY CURVES

FM RF ALIGNMENT PROCEDURE

	Connect Signal Generator	Generator Frequency	Receiver Dial Setting	Output Indicator and Connections	Adjust as Follows
6	Thru 270 ohm carbon resistor to high side FM antenna terminal	109 MC† (unmodulated).	Tuning gang wide open	Connect VTVM (DC probe) from point "W" to B minus ("Y"). See Fig. 7.	*G (osc.) for maximum VTVM reading.
7		102 MC† (unmodulated).	102 MC	"	*Tune in generator signal on receiver. Adj. H (ant.) for max. VTVM reading.

* It is advisable to adjust generator output so VTVM readings do not exceed approximately + 1.5 V. DC after peaking.
† If your signal generator does not reach this frequency, use harmonics as described in "FM Alignment Equipment."

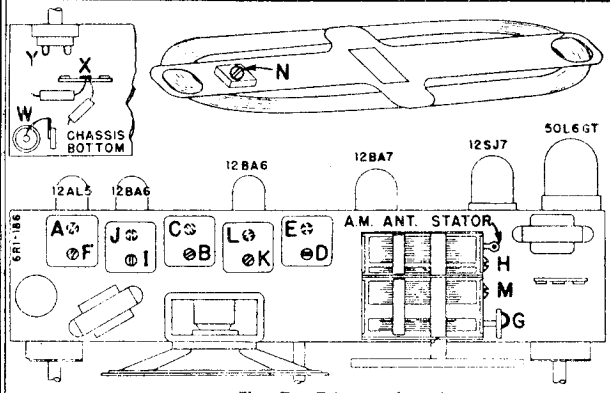

Fig. 7. Trimmer Location

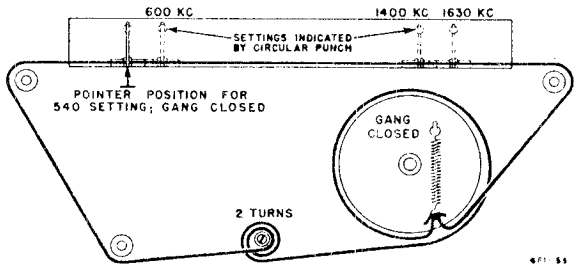

With the gang fully closed, the tip of the pointer clip should be in line with the 1/16" circular punch at the extreme left end of the dial background.

Fig. 8. Dial Stringing and Pointer Setting

AM ALIGNMENT PROCEDURE

- Use regular output meter connected across speaker voice coil.
- Turn receiver Volume Control full on; Tone Control fully clockwise.
- AM loop antenna must be connected and placed in the same relative position to the chassis as when in cabinet.
- Use lowest output setting of signal generator that gives a satisfactory reading on meter.

	Connect Signal Generator	Dummy Antenna Between Radio and Signal Generator	Signal Generator Frequency	Receiver Dial Setting	Adj. Trimmers in Following Order to Max.
	Set Band Switch to Broadcast Position (center) and be sure to follow instructions under heading "Important Preliminary Alignment Steps." Loop antenna must be connected.				
1	Gang condenser antenna stator	.1 MFD	455 KC	Tuning gang wide open	I, J (2nd IF) K, L (1st IF)
2	AM Antenna Stator	Direct connection	1620 KC	Tuning gang wide open	M (oscillator)
	Install chassis and AM loop in cabinet.				
3	Place generator lead close to loop of set to obtain adequate signal. No actual connection (signal by radiation).		1400 KC	Tune in signal	N (antenna)

Note: Trimmer adjustments J and L made from underside of chassis.

MODELS 6W11, 6W12; Ch. 6W1

IMPORTANT PRELIMINARY ALIGNMENT STEPS

Under normal operating conditions or use, misalignment of RF or IF circuits with age will be slight. Lack of sensitivity and poor tone quality may be due to causes other than alignment. Do not attempt to realign the receiver until all other possible causes have first been thoroughly investigated.

In FM alignment, it is essential that every step be followed. Especially important is picking the center of the IF curve (step 4 in the FM-IF alignment instructions). During this portion of the alignment it is necessary to tune the signal generator very carefully; it may necessitate having to estimate the dial readings to a tenth of a division.

If complete alignment is necessary, it is essential that proper sequence be followed as tabulated in the alignment chart. However, if only the AM band or a portion of the FM circuit are to be aligned, proceed from that point on the chart being sure to follow all remaining steps.

Adjustments made to FM-IF's at 10.7 MC, will require realignment of AM-IF slug adjustments.

Check pointer position. With tuning gang closed, the tip of the pointer clip should be over the 1/16" circular punch at the extreme left end of the dial background (see stringing diagram).

Use an isolation transformer if available, otherwise connect a .1 mfd. condenser in series with low side of signal generator and attach to B minus of chassis.

Be sure both the set and the signal generator are thoroughly warmed up before starting alignment.

FM I.F. AND RATIO DETECTOR ALIGNMENT

- Keep output indicator leads well separated from signal generator leads and chassis wiring.
- Band switch in FM position (fully to the left).
- While peaking IF's, keep reducing signal generator output so VTVM reading is approximately +1.5 volts DC with exception of Step #5.
- To avoid splitting the slotted head of iron core tuning slugs in the IF transformers, use a non-metallic alignment tool with a 1/8" wide screwdriver blade. Do not exert undue pressure as threads of slugs may strip.
- Speaker must be connected during alignment.
- FM antenna disconnected during alignment.

Before proceeding, be sure to follow all steps listed above, under "Important Preliminary Alignment Steps."

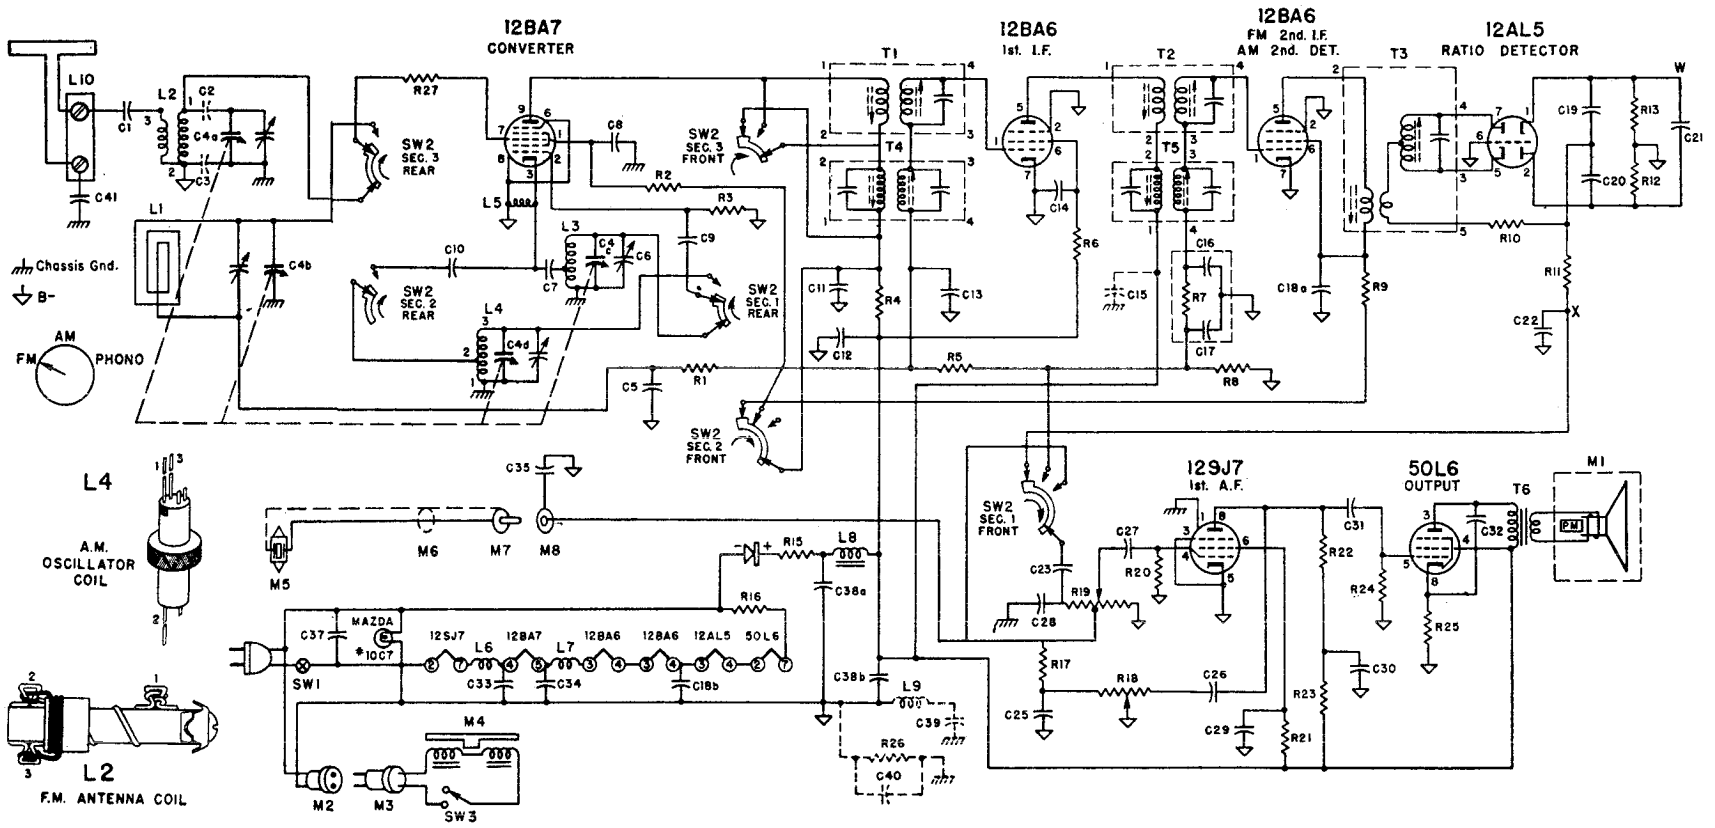
	Connect Signal Generator	Generator Frequency	Receiver Dial Setting	Output Indicator and Special Connections	Adjust as Follows (very carefully)
1	Thru .001 cond. to 2nd IF grid (pin #1 of 12BA6 2nd IF)	10.7 MC unmodulated.	Tuning gang wide open	Connect VTVM (DC probe) from point "W" to B minus ("Y"). (See Fig. 7.)	"A" (ratio detector primary) for maximum reading on VTVM.
2	**Thru .001 cond. to 1st IF grid (pin #1 of 12BA6 1st IF)	"	"	" "	Iron cores "B" and "C" (2nd IF trans.) for maximum reading on VTVM.
3	High side FM antenna terminal	"	"	" "	"D" and "E" (1st IF) for maximum on VTVM. Readjust A, B, C, D, E, for maximum. (Keep reducing generator output to keep VTVM at 1.5 volts)
4	"	a. Reduce output of signal generator until VTVM reads exactly +1.5 volts DC. b. Tune generator frequency above 10.7 MC until VTVM reads exactly +1.0 volt. Note exact generator frequency. Extreme care in reading this is essential. c. Tune generator frequency below 10.7 MC until VTVM reads exactly +1.0 volt. Note exact generator frequency. Extreme care in reading this is essential. d. Add generator frequency in step c to generator frequency in step b and divide by 2. The result is the center frequency of the IF curve to be used in step 5. See example on next page. e. Tune generator frequency above and below 10.7 MC and note voltage reading on VTVM at different frequency points until you have a good impression of the shape of the selectivity curve. If you have two peaks as in Figures 5 or 6, note readings (voltage) of both peaks. If one peak is over 20% higher than the other one, it will be necessary to realign IF's. A selectivity curve that would require realignment is illustrated by Figure 6.			
5	"	Center of IF selectivity curve per step 4d above. See "EXAMPLE" on next page.	Tuning gang wide open	Connect VTVM (DC probe) from point "X" to B minus ("Y"). (See Fig. 7.)	Iron core "F" (ratio detector secondary) for zero voltage reading on VTVM. (The correct zero point is located between a positive and a negative maximum.)

If any adjustments were very far off, it is desirable to repeat steps 3, 4 and 5.

**Do not feed I.F. signal into converter grid as this will cause mis-alignment.

Note: Trimmer adjustments A, C, and E made from underside of chassis.

© John F. Rider



FM ALIGNMENT EQUIPMENT

This chassis should be aligned only with an AM signal generator and a vacuum tube voltmeter. Any standard brand vacuum tube voltmeter with a DC scale of not over 5 volts is suitable. A 3-volt zero center scale is desirable. A signal generator with a frequency range up to 110 MC. is desirable. It is possible however, to align the receiver with a signal generator going to 20 or 30 megacycles, by using the harmonics of these lower frequencies. To do this merely set the signal generator dial as follows and align exactly as explained in the alignment instructions.

Where alignment chart specifies 109 MC., set signal generator to highest available frequency of the following:

109. MC	27.25 MC
54.50 MC	21.80 MC
36.33 MC	18.17 MC

Where alignment chart specifies 102 MC., set signal generator to highest available frequency of the following:

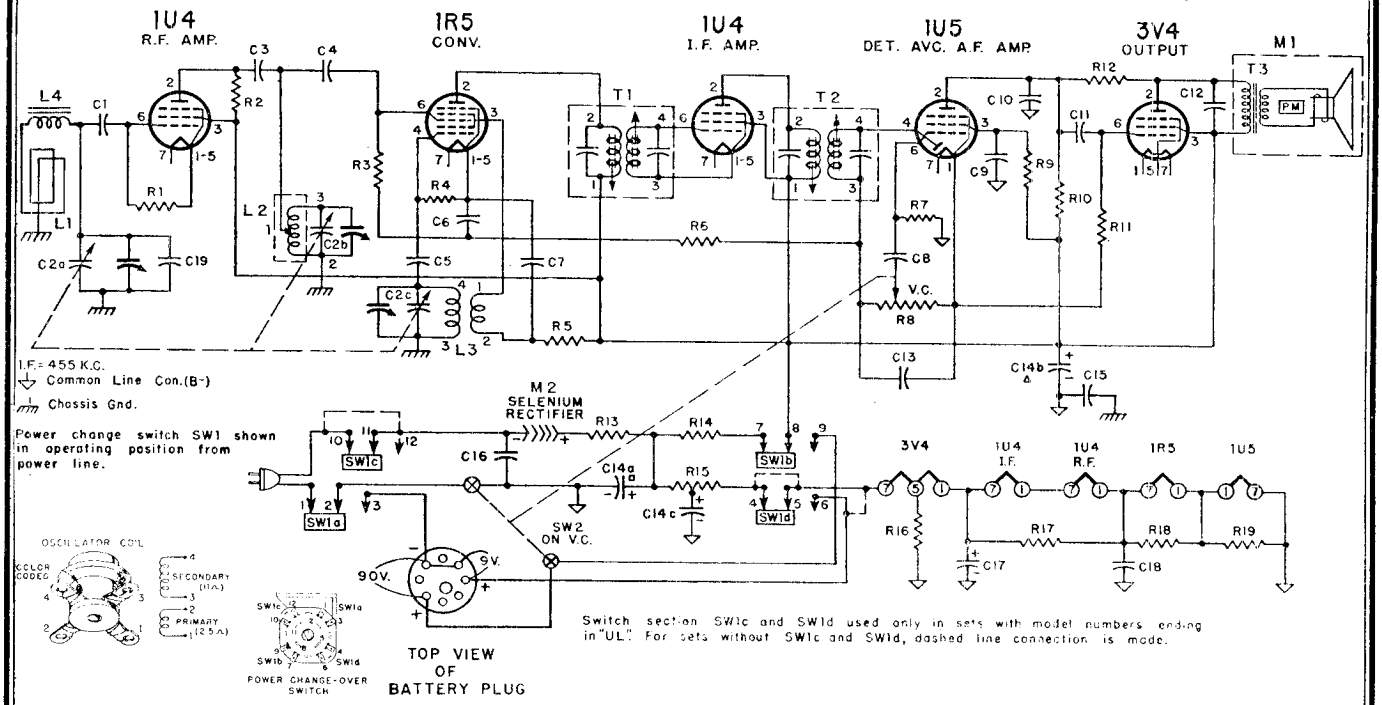
102. MC	25.50 MC
51. MC	20.40 MC
34. MC	17. MC

Signal generators which do not tune to 110 MC or whose harmonics are not strong enough, cannot be used for FM alignment.

CAUTION

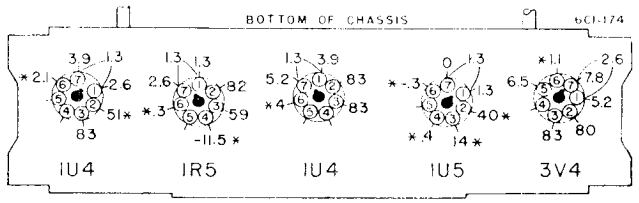
Do not connect a ground wire to this radio chassis.

MODELS 6Y18, 6Y19; Ch. 6Y1



VOLTAGE DATA

- Voltage readings taken between tube socket terminals and B minus (metal shell of electrolytic condenser), unless otherwise shown.
- Dial set to low frequency, no signal, and volume control minimum.
- Measurements made from 117 volts AC line. If measured from DC line, voltages may be slightly lower.
- Voltage readings taken with a vacuum tube voltmeter. Socket terminals marked with an asterisk * indicate much lower voltage or zero voltage if measured with a 1000 ohm-per-volt meter.
- If measurements are made on battery operation, tube filament and B plus voltages will vary with the condition of the batteries. These voltages will equal the terminal voltage of the A or B battery less the voltage drop through components.



*If taken with a 1000 ohm-per-volt meter, readings will be lower or zero.

ALIGNMENT PROCEDURE

- Use battery power for alignment if fresh batteries are available.
- When using AC power, an isolation transformer should be used if available. If not using an isolating transformer, connect a .1 mfd. condenser in series with the signal generator low side to B minus of radio chassis.
- Connect loop antenna and maintain same relative position as when in cabinet.
- Set volume control full on.
- Connect output meter across speaker voice coil.
- Use lowest output setting of signal generator capable of producing adequate output meter indication and then proceed as outlined below.
- Repeat adjustments to insure good results.

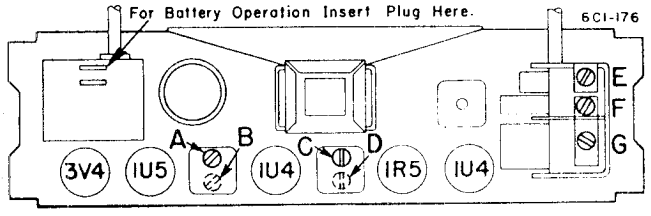
NOTE

To avoid splitting the slotted head of powdered iron core tuning slugs in I.F. transformer, use an alignment tool with a screw driver blade ⅛" wide.

Step	Dummy Antenna in Series with Signal Generator	Connection of Signal Generator (High Side)	Signal Generator Frequency	Receiver Gang Setting	Trimmer Description	Trimmer Designation	Type of Adjustment
1	.001 mfd. when using AC .1 mfd. when using Battery	Grid of 1R5 (Pin 6)	455 KC	Gang fully open	2nd IF 1st IF	A, B C, D (see note below)	Maximum output
2	.001 mfd. when using AC .1 mfd. when using Battery	Tuning condenser, antenna stator	1620 KC	Gang fully open	Oscillator (on gang)	E	Maximum output
3	.001 mfd. when using AC .1 mfd. when using Battery	Tuning condenser, antenna stator	1400 KC	Tune in generator signal	R. F. (on gang)	F	Maximum output
Install chassis in cabinet. Mount dial pointer. Set pointer at 1400 K.C. with gang condenser tuned to 1400 K.C. signal.							
4	Loop of several turns of wire, or place generator lead close to receiver loop for adequate signal.	No physical connection (signal by radiation)	1400 KC	Tune in generator signal	Antenna (on gang)	G	Maximum output

NOTE: Adjustments B and D are made from underside of chassis.

TUBE AND TRIMMER LOCATION



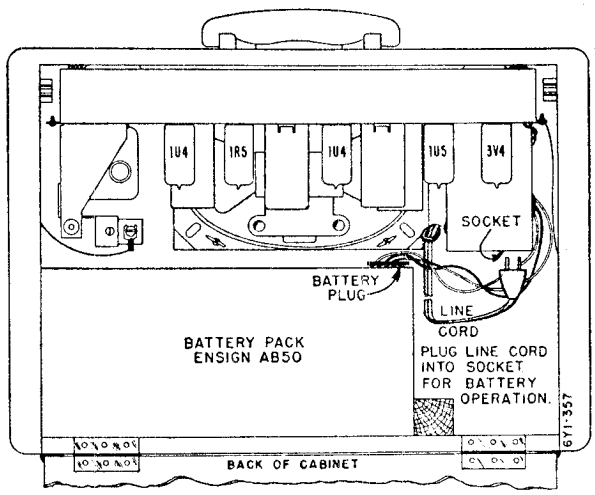
REPLACEMENT OF BATTERY PACK

Replace A-B battery pack with Ensign type AB50 pack, Ray-O-Vac AB994, General 60A-6F6-5, Burgess F6A60 or other equivalent.

Electrical characteristics of the recommended battery packs provide for equal life for both the A and B sections. The A section may give satisfactory performance as low as 6.6 volts, the B section as low as 60 volts. Replace battery pack when reception is weak and voltage has dropped below values given above.

To install a replacement battery pack, merely open the back of the cabinet, pull out the battery plug and slide out the run-down battery pack.

Slip a new battery pack into place, plug in the battery plug.



©John F. Rider

RADIO TILT-OUT DOOR ADJUSTMENT

If the door on the radio tilt-out assembly is shifted to one side, readjustment of the tilt-out arm will correct the difficulty. If the tilt-out door is too far to the right, the right-hand tilt-out arm can be sprung. If the door is too far to the left, the left-hand arm can be sprung. The tilt-out arms are sprung by holding the lower end of the arm against its bracket and prying the arm toward the chassis with a screwdriver. The screwdriver is used as a lever between the tilt-out arm and the side of the radio compartment.

In the event that the bottom edge of the radio tilt-out door rubs, it can be planed off slightly. Care must be exercised in doing this in order that the door is not marred. Hold the plane flat against the beveled bottom edge of the door while planing off a small amount.

ALIGNMENT PROCEDURE

FM ALIGNMENT EQUIPMENT

The model 8D1 chassis should be aligned only with an AM signal generator and a vacuum tube voltmeter. Any standard brand vacuum tube voltmeter with a DC scale of not over 5 volts is suitable. A 3-volt zero center scale is desirable. A signal generator with a frequency range up to 110 MC. is desirable. It is possible however, to align the receiver with a signal generator going to 20 or 30 megacycles, by using the harmonics of these lower frequencies. To do this merely set the signal generator dial as follows and align exactly as explained in the alignment instructions.

Where alignment chart specifies 109 *MC.*, set signal generator to highest available frequency of the following:

109. MC	27.25 MC
54.50 MC	21.80 MC
36.33 MC	18.17 MC

Where alignment chart specifies 102 *MC.*, set signal generator to highest available frequency of the following:

102. MC	25.50 MC
51. MC	20.40 MC
34. MC	17. MC

Signal generators which do not tune to 110 MC or whose harmonics are not strong enough, cannot be used for FM alignment.

POINTER SETTING

With the gang closed, the pointer should be at the position as shown in the stringing diagram (Fig. 4), that is, the bottom edge of the pointer should line up with the top of the "MC" lettering on the dial scale. If the pointer is in a different position, move it by hand while keeping the gang closed.

TRIMMER IDENTIFICATION CHART

Trimmer Symbol		Function
A	T3	Ratio Detector transformer
B	T2	2nd IF transformer (FM)

SETTING SIGNAL GENERATOR TO CENTER OF I.F. SELECTIVITY CURVE

CAUTION: Due to the difficulty of setting a signal generator to the accuracy required by this operation, extreme care must be exercised in making each setting. Otherwise, improper alignment of the ratio detector and consequent audio distortion will result.

EXAMPLE: (See Figures 5 and 6)

Voltage reading in Step 4a is + 1.5 volts.

Generator frequency on low side of 10.7 MC for a reading of + 1 volt DC = 10.640 MC.

Generator frequency on high side of 10.7 MC for a reading of + 1 volt DC = 10.800 MC.

Center frequency is obtained by adding 10.640 and 10.800, then dividing by 2. For these readings it will be 10.72 MC.

Set generator frequency to 10.72 MC as this is center of selectivity curve as shown in Figure 6.

Note: Numerical vernier dial readings may be used instead of MC.

MODELS 8D15, 8D16; Ch. 8D1

IMPORTANT PRELIMINARY ALIGNMENT STEPS

In FM alignment, it is essential that every step be followed. Especially important is picking the center of the I.F. curve (step 4 in the FM-I.F. alignment instructions). During this portion of the alignment it is necesary to tune the signal generator very carefully; it may necessitate having to estimate the dial readings to a tenth of a division.

- Check the set screws that hold the tuning drum to the shaft to see that they are tight and that the drum has not slipped on the shaft. The correct position of the drum can be seen in the stringing diagram.
- With the gang closed, the pointer should be at the position as shown in the stringing diagram, that is, the bottom edge of the pointer should line up with the top of the "MC" lettering on the dial scale. If the pointer is in a different position, move it by hand while keeping the gang closed.
- Be sure both the set and the signal generator are thoroughly warmed up before starting alignment.

FM I.F. AND RATIO DETECTOR ALIGNMENT

- Keep output indicator leads well separated from signal generator leads and chassis wiring.
- Band switch in FM position (fully to the left).
- While peaking IF's, keep reducing signal generator output so VTVM reading is approximately +1.5 volts DC with exception of Step #5.
- Speaker must be connected during alignment.
- FM antenna disconnected during alignment.

I.F. SLUG INFORMATION

To avoid splitting the slotted head of the powdered iron core tuning slug in the I.F. transformers, use a screw-driver with a blade ⅛" wide for I.F. alignment.

Under normal operating conditions, mis-alignment of slug-tuned circuits with age is slight. Therefore, re-alignment of the I.F. transformers should be accomplished by only a slight adjustment of the slugs.

Before proceeding, be sure to follow all steps listed above, under "Important Preliminary Alignment Steps."

	Connect Signal Generator	Generator Frequency	Receiver Dial Setting	Output Indicator and Special Connections	Adjust as Follows (very carefully)
1	Thru .001 cond. to pin # 1 of 6BA6 RF amplifier**	10.7 MC unmodulated.	Tuning gang wide open	Connect VTVM (DC probe) from point "W" to ground. (See Fig. 11.)	"A" (ratio detector primary) for maximum reading on VTVM.
2	"	"	"	" "	Iron cores "B" and "C" (2nd IF trans.) for maximum reading on VTVM.
3	"	"	"	" "	Iron cores "D" and "E" for maximum on VTVM. Readjust A, B, C, D, E, for maximum. (Keep reducing generator output to keep VTVM at 1.5 volts).
4	"	a. Reduce output of signal generator until VTVM reads **exactly** +1.5 volts DC. b. Tune generator frequency above 10.7 MC until VTVM reads **exactly** +1.0 volt. Note **exact** generator frequency. Extreme care in reading this is essential. c. Tune generator frequency below 10.7 MC until VTVM reads **exactly** +1.0 volt. Note **exact** generator frequency. Extreme care in reading this is essential. d. Add generator frequency in step c to generator frequency in step b and divide by 2. The result is the center frequency of the IF curve to be used in step 5. See example on next page. e. Tune generator frequency above and below 10.7 MC and note voltage reading on VTVM at different frequency points until you have a good impression of the shape of the selectivity curve. If you have two peaks as in Figures 9 or 10, note readings (voltage) of both peaks. If one peak is over 20% higher than the other one, it will be necessary to realign IF's. A selectivity curve that would require realignment is illustrated by Figure 10.			
5	"	Center of IF selectivity curve per step 4d above. See "EXAMPLE" on next page.	Tuning gang wide open	Connect VTVM (DC probe) from point "X" to ground. (See Fig. 11.)	Iron core "F" (ratio detector secondary) for zero voltage reading on VTVM. (The correct zero point is located between a positive and a negative maximum.)

If any adjustments were very far off, it is desirable to repeat steps 3, 4 and 5.

**Do not feed I.F. signal into converter grid as this will cause mis-alignment.

FM SERVICE

Much of FM service is similar to the usual service necessary for AM receivers such as voltage analysis, parts replacement, etc. The chief differences arise because of the considerably higher frequencies used in FM operation, and because of the different type of second detector needed in FM.

The higher frequencies involved means that more care must be exercised in location and length of leads. Leads tend to act as small inductances or capacities at high frequency and hence may appreciably alter the electrical characteristics of a circuit. For this reason, ground connections should always be maintained as originally made in the set. Also note that in certain circuits, the type by-pass condenser used is critical at the high FM frequencies. When replacing condensers it is important that they be replaced with condensers of identical capacity values, tolerances, temperature coefficients and construction.

MODELS 9E15, 9E16, 9E17; Ch. 9E1

VOLTAGE CHART

- Line Voltage 117.
- Voltage readings taken with a vacuum tube voltmeter. Socket terminals marked with an asterisk * indicate much lower voltage or zero voltage if measured with a 1000 ohm-per-volt meter.
- Voltages read between socket terminals and ground, unless otherwise indicated.
- Band switch in FM position.
- Dial turned to low frequency end.
- Volume Control—minimum.

IMPORTANT PRELIMINARY ALIGNMENT STEPS

In FM alignment, it is essential that every step be followed. Especially important is picking the center of the IF curve (step 4 in the FM-IF alignment instructions). During this portion of the alignment it is necessary to tune the signal generator very carefully; it may necessitate having to estimate the dial readings to a tenth of a division.

Under normal operating conditions or use, misalignment of RF or IF circuits with age will be slight. Lack of sensitivity and poor tone quality may be due to causes other than alignment. Do not attempt to realign the receiver until all other possible causes have first been thoroughly investigated.

When completely aligning the FM circuit, it is essential to follow the sequence of steps indicated in the chart. If only a portion of the FM circuit is being aligned, be sure to follow all the remaining steps.

Check the set screws that hold the tuning drum to the shaft to see that they are tight and that the drum has not slipped on the shaft. The correct position of the drum can be seen in the stringing diagram.

With the gang open, the pointer should be at the position as shown in the stringing diagram, that is, the end of the pointer should line up with the "AM" lettering on the dial scale. If the pointer is in a different position, move it by hand while keeping the gang open.

Be sure both the set and the signal generator are thoroughly warmed up before starting alignment.

AM ALIGNMENT PROCEDURE

- Use regular output meter connected across speaker voice coil.
- Turn receiver Volume Control full on; Tone Control full treble.
- AM loop antenna must be connected and placed in the same relative position to the chassis as when in cabinet.
- Use lowest output setting of signal generator that gives a satisfactory reading on meter.

Step	Connect Signal Generator	Dummy Antenna Between Radio and Signal Generator	Signal Generator Frequency	Receiver Dial Setting	Adj. Trimmers in Following Order to Max.
	Set Band Switch to Broadcast Position (center) and be sure to follow instructions under heading "Important Preliminary Alignment Steps." Loop antenna must be connected.				
1	Gang condenser antenna stator	.1 MFD	455 KC	Tuning gang wide open	A-B (2nd IF) C-D (1st IF)
2	Lug on AM Antenna Stator	.1 MFD	1620 KC	Tuning gang wide open	E (oscillator)
3	Place generator lead close to loop of set to obtain adequate signal. No actual connection (signal by radiation).		1400 KC	Tune in signal	F (antenna)

AM antenna trimmer adjustment "F" in step 3 should be repeated after set and antenna have been installed in cabinet. Important: AM antenna trimmer may not peak properly if antenna leads are not routed properly or separated as originally made.

FM ALIGNMENT EQUIPMENT

This chassis should be aligned only with an AM signal generator and a vacuum tube voltmeter. Any standard brand vacuum tube voltmeter with a DC scale of not over 5 volts is suitable. A 3-volt zero center scale is desirable. A signal generator with a frequency range up to 110 MC. is desirable. It is possible however, to align the receiver with a signal generator going to 20 or 30 megacycles, by using the harmonics of these lower frequencies. To do this merely set the signal generator dial as follows and align exactly as explained in the alignment instructions.

Where alignment chart specifies 109 MC, 106 MC, 90 MC or 87 MC, set signal generator to highest available frequency shown in the column under that frequency.

All frequencies in megacycles

109.	106.	90.	87.
54.50	53.	45.	43.5
36.33	35.33	30.	29.
27.25	26.5	22.5	21.75
21.80	21.2	18.	17.4
18.17	17.66	15.	14.5

Signal generators which do not tune to 110 MC or whose harmonics are not strong enough, cannot be used for FM alignment.

©John F. Rider

MODELS 9E15, 9E16, 9E17; Ch. 9E1

FM I.F. AND RATIO DETECTOR ALIGNMENT

- Keep output indicator leads well separated from signal generator leads and chassis wiring.
- Band switch in FM position (fully to the right).
- While peaking IF's, keep reducing signal generator output so VTVM reading is approximately +1.5 volts DC with exception of Step #5.
- To avoid splitting the slotted head of iron core tuning slugs in the IF transformers, use an insulated alignment tool with a ⅛" wide screwdriver blade. Do not exert undue pressure as threads of slugs may strip.
- Speaker must be connected during alignment.
- FM antenna disconnected during alignment.

Before proceeding, be sure to follow all steps listed under "Important Preliminary Alignment Steps."

	Connect Signal Generator	Generator Frequency	Receiver Dial Setting	Output Indicator and Special Connections	(Adjust as Follows very carefully)
1	Thru .001 cond. to pin #1 of 6BA6 2nd IF. (Ground to chassis, close to tube.)	10.7 MC unmodulated.	Tuning gang wide open	Connect VTVM (DC probe) from point "W" to chassis. (See Fig. 10)	"G" (ratio detector primary) for maximum reading on VTVM
2	**Thru .001 cond. to pin #1 of 6BA6 1st IF. (Ground to chassis, close to tube).	"	"	" "	"H" and "I" (2nd IF trans.) for maximum reading on VTVM.
3	Across ends of FM antenna twin lead	"	"	" "	"J" and "K" (1st IF trans.) for maximum on VTVM. Readjust G, H, I, J, K, for maximum. (Keep reducing generator output to keep VTVM at 1.5 volts)
4	"	a. Reduce output of signal generator until VTVM reads **EXACTLY** +1.5 volts DC. b. Tune generator frequency above 10.7 MC until VTVM reads **EXACTLY** +1.0 volt. Note **EXACT** generator frequency. Extreme care in reading this is essential. c. Tune generator frequency below 10.7 MC until VTVM reads **EXACTLY** +1.0 volt. Note **EXACT** generator frequency. Extreme care in reading this is essential. d. Add generator frequency in step c to generator frequency in step b and divide by 2. The result is the center frequency of the IF curve to be used in step 5. See example under heading "Setting Signal Generator to Center of I.F. Selectivity Curve". e. Tune generator frequency above and below 10.7 MC and note voltage reading on VTVM at different frequency points until you have a good impression of the shape of the selectivity curve. If you have two peaks as in Figures 7 or 8, note readings (voltage) of both peaks. If one peak is over 20% higher than the other one, it will be necessary to realign IF's. A selectivity curve that would require realignment is illustrated by Figure 9.			
5	"	Center of IF selectivity curve per step 4d above.	Tuning gang wide open	Connect VTVM (DC probe) from point "X" to chassis. (See Fig. 10.)	"L" (ratio detector secondary) for zero voltage reading on VTVM. (The correct zero point is located between a positive and a negative maximum.)

If any adjustments were very far off, it is desirable to repeat steps 3, 4 and 5.

Do **not feed I.F. signal into converter grid as this will cause mis-alignment.

SETTING SIGNAL GENERATOR TO CENTER OF I.F. SELECTIVITY CURVE

CAUTION: Due to the difficulty of setting a signal generator to the accuracy required by this operation, extreme care must be exercised in making each setting. Otherwise, improper alignment of the ratio dectector and consequent audio distortion will result.

EXAMPLE: (See Figures 4 and 5)

Voltage reading in Step 4a is + 1.5 volts.

Generator frequency on low side of 10.7 MC for a reading of + 1 volt DC = 10.640 MC.

Generator frequency on high side of 10.7 MC for a reading of + 1 volt DC = 10.800 MC.

Center frequency is obtained by adding 10.640 and 10.800, then dividing by 2. For these readings it will be 10.72 MC.

Set generator frequency to 10.72 MC as this is center of selectivity curve as shown in Figure 5.

Note: Numerical vernier dial readings may be used instead of MC.

MODELS 9E15, 9E16, 9E17; Ch. 9E1

FM RF ALIGNMENT PROCEDURE

Step	Connect Generator	Generator Frequency	Receiver Gang or Dial Setting	Output Connections	Adjust as follows (very carefully)
1	To ends of FM antenna twin lead thru 120 ohm carbon resistors in series with each generator lead.	†109 MC (unmodulated)	Gang fully open	Connect VTVM (DC probe) from point "W" to chassis.	*M (oscillator) and N (antenna) for maximum
2		87 MC (unmodulated)	Tune in Signal. (Gang should be closed or almost closed.)	"	If signals in steps 1 and 2 will not tune in at gang tuning extreme (±0.5 MC), it will be necessary to spread or squeeze oscillator coil turns and then repeat steps 1 and 2 until correct results are obtained.
3		106 MC (unmodulated)	Tune in Signal	"	Readjust N for maximum VTVM reading, while rocking gang. If trimmer does not peak, it will be necessary to squeeze or spread turns of FM antenna coil. Check calibration and tracking at 90 MC. Calibration error should not exceed ±0.5 MC. If necessary, repeat steps 1, 2, 3 until correct results are obtained.

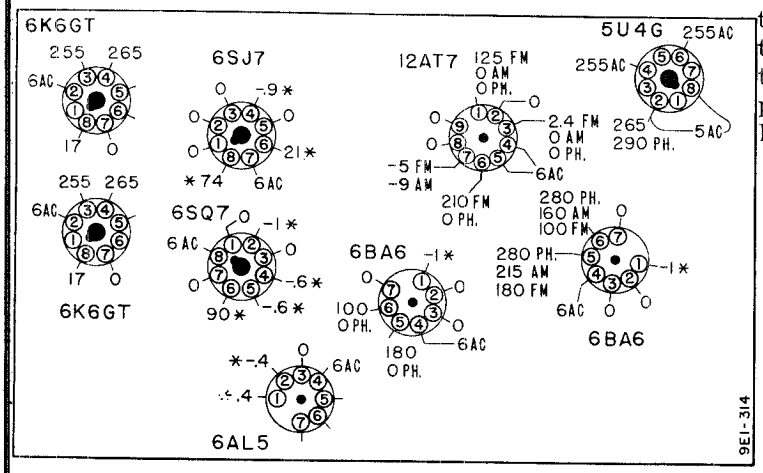
* It is advisable to adjust generator output so VTVM readings do not exceed approximately +1.5 V. DC while peaking.
† If your signal generator does not reach this frequency, use harmonics as described in "FM Alignment Equipment."

IMPORTANT

AM antenna trimmer adjustment "F" in step 3 of "AM Alignment Procedure" should be repeated after receiver and antenna have been installed in cabinet. Note: AM antenna trimmer may not peak properly if antenna leads are not routed properly or separated as originally made.

POINTER SETTING

With the gang open, the pointer should be at the position as shown in the stringing diagram, that is, the end of the pointer should line up with the "AM" lettering on the dial scale. If the pointer is in a different position, move it by hand while keeping the gang open.



*If taken with a 1000 ohm-per-volt meter, readings will be lower or zero.

POWER SUPPLY. This receiver is designed to operate on self-contained batteries or on either an AC or DC power supply when such a supply is available. (For battery information, see section on batteries.) The receiver will operate on either AC (50 to 60 cycles) with a voltage of 110 to 120 or DC with a voltage from 110 to 120.

This receiver will accommodate any of the batteries listed below:

Manufacturer	Manufacturer's Type Number "A" Battery	"B" Battery

SERVICE DATA

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT: Remove the chassis and batteries from the cabinet and remove the bottom enclosure plate from the chassis. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (1R5) through a .05 or .1 MFD condenser. The ground of the test oscillator should be connected to the buss. Align all four I.F. slugs to peak or maximum reading on the output meter. Each I.F. has an adjustment at the top and bottom of the can. The peaks on the slugs must be the ones farthest out of the coils.

R.F. ALIGNMENT: Place the cabinet on its face and open cabinet back to a 90° angle. Lay a board across the body of cabinet ahead of the loop. Replace the bottom chassis enclosure and set the chassis and batteries on the board so that they occupy the same relative position to the loop as they do in the cabinet. Care should be taken to have no iron or other metal near the loop.

Connect the test oscillator to a dummy loop which can be made by coiling 2 turns of hookup wire about 6" in diameter. Place this dummy loop about a foot from the loop on the receiver and in the same plane as the receiver loop. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on the gang condenser. Next set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC. and tune in signal on condenser to check alignment of coils.

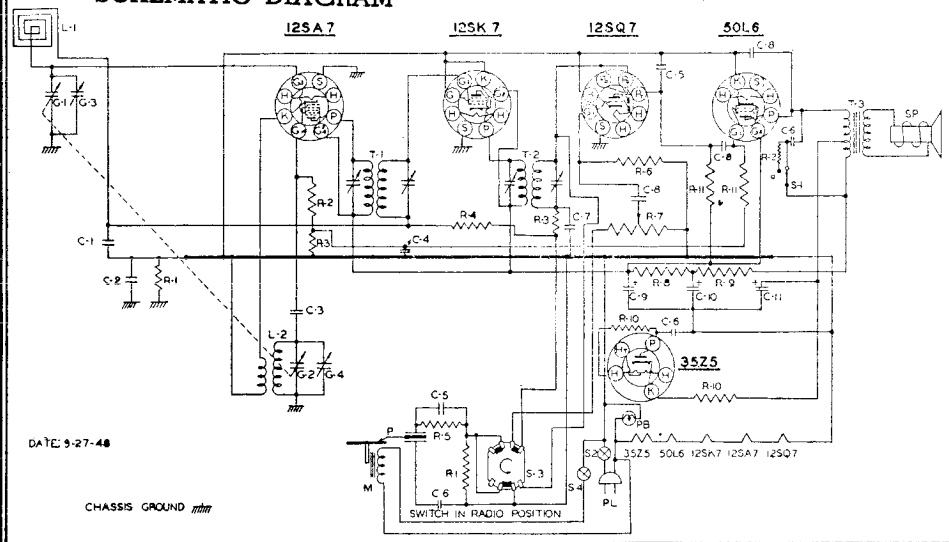
SCHEMATIC DIAGRAM

SD-77 U



CAUTION: Never plug this unit into a 220 Volt or a DC power source as you will seriously damage the component parts, which have been designed for 110 to 125 volts AC current at 60 cycles only.

POWER SUPPLY: This receiver is designed to operate from a power source of 110 to 125 volts AC current at 60 cycles only.

ALIGNMENT DATA

Remove the chassis from the cabinet. A Signal Generator with the following frequencies is required: 455 KC, 1400 KC and 1720 KC.

The receiver volume control should be turned to maximum during the I.F. and all subsequent alignments to keep the A.V.C. from working and giving false readings. Turn the tone control to complete left hand position. Keep the generator output as low as possible to prevent overloading.

Connect an output meter across the voice coil of the speaker.

Connect a 20,000 ohm resistor across the loop connector terminals to reflect proper loop impedance.

FIRST STEP: Connect the hot lead from the generator to the "ANT." section of the gang condenser through a .1 MFD. condenser. The ground lead must be connected to the floating ground buss under the chassis. Turn the gang condenser to complete minimum capacity. Adjust the generator to 455 KC and adjust the trimmers of the 1st and 2nd I.F. transformers until a maximum reading is noted on the output meter.

SECOND STEP: With the leads from the generator connected in the same manner as in I.F. alignment, adjust the signal generator to 1720 KC. The "O.S.C." trimmer is located on the front section of the gang condenser. Adjust this trimmer until the signal is tuned in. The gang condenser should be at complete minimum capacity for this setting.

THIRD STEP: Remove the generator leads from the chassis. Remove the 20,000 ohm resistor from the loop connector terminals. Reinstall the chassis in the cabinet, connect the loop leads, motor plug and phono pickup leads.

Connect the generator leads to a transmitting loop, made of a few turns of wire, and loosely couple to the receiver loop antenna which is located on the back end of the cabinet. Adjust the generator to 1400 KC. Rotate the tuning control until this signal is tuned in. The "ANT." trimmer is located on the rear section of the gang condenser. Adjust this trimmer until a maximum signal is noted on the output meter.

No further adjustment should be necessary, unless the receiver has been damaged, as the coils and tuning condenser have been specially handled at the factory to insure proper alignment at the lower frequencies.

© John F. Rider

POWER SUPPLY. This receiver is designed to operate on any alternating current supply (AC) ranging from 110 to 120 volts, 50 to 60 cycles; or on any direct current supply (DC) ranging from 110 to 120 volts.

AERIAL SYSTEM

This receiver has a built-in "loop" aerial. Its excellent design is such as to increase pick-up from stations having wide variations in signal strength. The efficiency and selectivity of the loop provide outstanding reception without the use of an external aerial. The "loop" aerial used on this receiver is somewhat directional so reception from weak stations can be improved by turning the set in the proper direction. In or near metal buildings, iron ore deposits or steel structures or in localities remote from broadcasting stations, reception can be improved by using an outside aerial 50 feet to 100 feet in length including lead-in. Connect the outside aerial to the aerial lead. When using the outside aerial with AC power supply it may be necessary to reverse the power cord plug in wall socket to eliminate hum or distortion.

TUBES USED

Six tubes are used. Type numbers and locations are shown in the tube location diagram on the cabinet. If tubes are removed from their sockets for test or replacement purposes, make certain that each tube is placed in its proper socket when replacing the tubes in the set. Failure to replace the tubes in their proper sockets may result in damage to the tube, or to the receiver, or both.

TUNING RANGE

This receiver is designed to operate over the standard broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters).

DIAL CALIBRATION. The scale is calibrated from 55 to 160 (Standard Broadcast). This band covers all Standard Broadcasts frequencies of the United States, Canada, Mexico, Cuba and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

One end of the indicator points to the wave length in meters. Therefore, both wave length in meters and frequency in kilocycles can be read at each setting of dial indicator.

SERVICE DATA

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED. OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to the antenna of the set through a 100 mmfd. (.0001) condenser. With the gang condenser set at minimum capacity, set the test oscillator at 1620 KC, and adjust the oscillator (or 1620 KC trimmer) on gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

MODEL 8G-200, 8G-201

TUNING RANGE

This receiver is designed to operate over two tuning ranges; the broadcast band which extends from 535 to 1620 Kilocycles (KC) (185 to 560 Meters), and the Frequency Modulation (FM) Band which extends from 87 to 109 Megacycles (MC).

DIAL CALIBRATION. (Standard Broadcast Band.) The upper scale is calibrated from 55 to 160 (Standard Broadcast). This band covers all Standard Broadcast frequencies of the United States, Canada, Mexico, Cuba, and many Central and South American Countries. Add a zero to figures on the scale to obtain kilocycles.

DIAL CALIBRATION. (Frequency Modulation Band.) The entire lower scale is calibrated from 88 to 108 Megacycles (201 to 300 FM channels) which covers the entire popular Frequency Modulation (FM) Band.

BROADCAST ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED: Modulated Test Oscillator that will cover the frequencies of 455, 600, 1400 and 1620 KC, also an Output Meter to connect across the primary or secondary of the output transformer.

I. F. ALIGNMENT: Put switch in the broadcast position and connect the test oscillator to the converter grid through a .05 condenser. The ground lead of the test oscillator should be connected to the buss of the receiver. Adjust the four I. F. trimmers (F,G,L and K) for maximum reading on the output meter. Always use the peak on the slug which is obtained when screw is out of the can the greatest distance.

R. F. ALIGNMENT: Connect the test oscillator to the antenna lead on the loop through a 100 mmf. condenser. Set the gang condenser to the maximum high frequency position and the test oscillator to 1620 KC. Adjust Trimmer "C" to the maximum output. Set test oscillator to 1400 KC and tune in signal with the gang condenser and adjust Trimmer "A" to maximum response. Set test oscillator to 600 KC and tune in signal with gang condenser. Check for damage to gang condenser or coils.

F. M. ALIGNMENT PROCEDURE

EQUIPMENT REQUIRED: F. M. Generator with frequencies of 90, 98, 106, and 109 megacycles, and generator without any modulation which covers 10.7 megacycles, also a zero center microammeter, and a DC Vacuum Tube Voltmeter (An oscilloscope and variable frequency audio oscillator can be used for better results. This method of alignment is described in the last paragraph).

DISCRIMINATOR ALIGNMENT: Connect DC Vacuum Tube Voltmeter between the buss and point "XX" on circuit diagram. Point "XX" is negative potential on the vacuum tube voltmeter. Isolate point "XX" and buss connections to vacuum tube voltmeter with chokes made by wrapping approximately 20 turns of hookup wire around a pencil. This is illustrated in Figure 1. Connect two 100,000 ohm resistors in series. (These resistors must match to 5%.) Connect them from point "XX" to buss. Between junction of 100,000 ohm resistors and the point "YY" connect Zero Center Meter, which is also isolated by the choke described above. These connections are illustrated in Figure 1. Connect test oscillator which is adjusted to 10.7 megacycles to grid of IF Driver through a 250 mmf condenser. Adjust slug "M" to maximum on the vacuum tube voltmeter. Reduce test oscillator to keep vacuum tube voltmeter to around 5 volts. Adjust slug "N" to bring zero center meter to zero point. Slug "N" should never be touched after this alignment.

PRELIMINARY IF ALIGNMENT: Connect test oscillator to the converter grid through a 250 mmf. mica condenser. Adjust slugs D, E, H and J to maximum output on the vacuum tube voltmeter. In making these adjustments reduce the generator input to keep the vacuum tube voltmeter at approximately 5 volts when making this adjustment. Always use the peak on the slug which is obtained when the screw is out of the can the greatest distance.

FINAL I. F. ALIGNMENT: Set the test oscillator to 109 MC without frequency moldulation and connect it to converter grid. Adjust trimmer "B" for approximate maximum output on the vacuum tube voltmeter and zero center for exact centering. Adjust test oscillator to approximately 25 KC deviation, carefully adjust trimmers D, E, H, J and M for maximum on vacuum tube voltmeter. It may be necessary to shift the frequency of the oscillator slightly to hold the zero center meter on center. In making this adjustment turn up volume control slightly to obtain an audio signal out of the speaker. If this signal is free of distortion, increase the deviation to approximately 75 KC and repeat the above alignment. If this is done carefully there will be no distortion in the speaker with this deviation. If distortion is obtained in the speaker with this deviation, it will be necessary to carefully repeat the I.F. alignment.

R. F. ALIGNMENT: Move the signal generator to the FM antenna terminals, using 150 ohm resistors between the generator terminals and each of the FM antenna terminals. Set the test oscillator to 106 megacycles and tune in signal with gang condenser to obtain approximate maximum on the vacuum tube voltmeter and zero center on the meter. Slightly bend the RF section in the gang condenser for maximum output with vacuum tube voltmeter. Set the signal generator to 98 megacycles, tune in signal with the gang condenser. Repeat the above procedure at this frequency and also at 90 megacycles. Recheck alignment at 106 megacycles.

POWER SUPPLY. This receiver is designed to operate on any alternating current supply (AC) ranging from 110 to 120 volts, 50 to 60 cycles; or on any direct current supply (DC) ranging from 110 to 120 volts.

FINAL ALIGNMENT OF FM IF WITH OSCILLOSCOPE AND VARIABLE AUDIO OSCILLATOR: The oscilloscope and variable audio oscillator should be connected as shown in Figure 2. Adjust the deviation to approximately 25 KC and align trimmers D, E, H, J and M to maximum on the vacuum tube voltmeter while watching the oscilloscope for a straight line. It may be necessary to vary the frequency of the variable audio oscillator in order to make the line straight on the scope. Next increase deviation to approximately 75 KC and repeat procedure, adjusting for maximum or as close to maximum as it is possible to obtain without losing the straight line on the oscilloscope. After all the trimmers have been properly adjusted to a maximum and a straight line on the scope, increase the deviation from approximately 125 to 150 KC. The curves illustrated in Figure 3 should be obtained. In making the above adjustments it may be necessary to make slight variations in the RF frequency in order to hold the zero center meter at the zero point.

OPERATING INSTRUCTIONS

Miniature Superheterodyne Broadcast Tuner — Model A-600

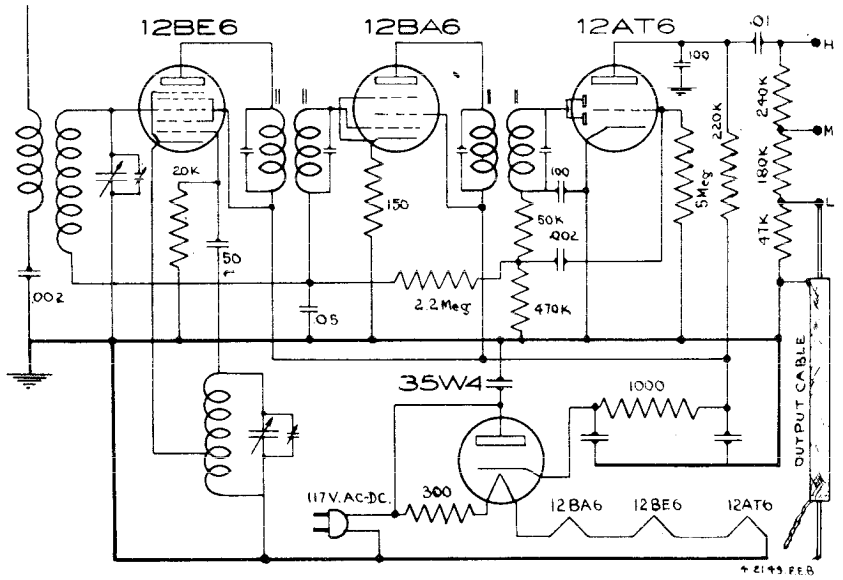
Introduction:

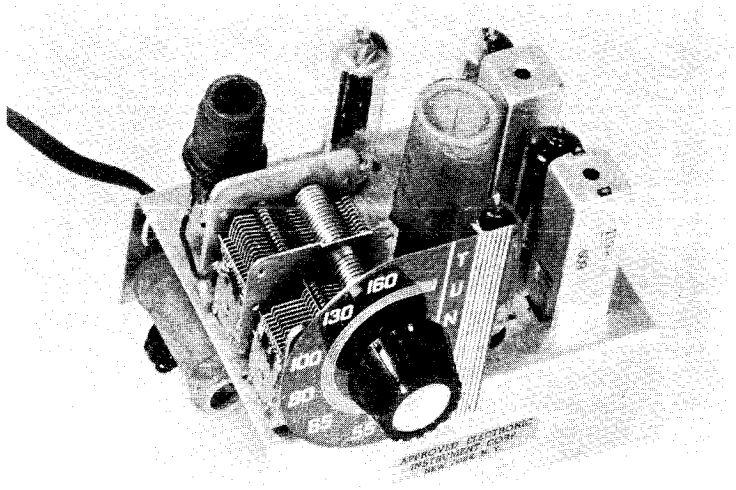
The circuit of this tuner is a standard superheterodyne of high efficiency, using miniature tubes throughout. A.C.-D.C. circuitry is used and therefore CARE SHOULD BE EXERCISED WHEN THIS TUNER IS CONNECTED TO OTHER EXISTING EQUIPMENT. Inasmuch as the audio output cable is connected to the power line (for low hum consideration) it would be unreasonable to float the chassis. While it is possible to do so and insert a fairly large paper capacitor in return with the output cable shield, the existing above ground voltage between the cable shield and power line ground would result in unbearable hum conditions. In order to avoid fuse blowouts or shock, it is ABSOLUTELY NECESSARY THAT THE POLARITY OF THE TUNER POWER LINE CORD IS SUCH THAT THE TUNER CHASSIS AND ASSOCIATED EQUIPMENT ASSUMES THE SAME POLARITY IN RESPECT TO THE POWER LINE GROUND. This can be easily checked with an A.C. voltmeter. The output cable is attached within the tuner to the low output tap. If higher output is desired connect the output cable to the medium or high output as shown in the diagram below.

Specifications:
With a strong signal tuned in -

A.V.C.:	3-7 volts.
Oscillator Grid	8-11 "
IF Frequency	455 Kc.
Selectivity	10/down 7Kc.
Gain- Ant.	5
Gain- Converter	30
Gain- IF	60
Output impedance	High
Audio output	10 - 5 - 1 volt Adjustable in 3 steps.
Power consumption	25 Watts
D.C. Voltage	110-120 volts
Total current	25 mils.

Tubes: 1 - 35W4 Rectifier
1 - 12AT6 Diode Audio
1 - 12BA6 IF Amplifier
1 - 12BE6 Converter





MODEL A-600 AC

OPERATING INSTRUCTIONS

Miniature Superheterodyne Broadcast Tuner — Model A-600 AC

Introduction:

The circuit of this tuner is a standard superheterodyne of high efficiency, using miniature tubes. The power supply is a standard 117V. 60 cycle, fullwave rectifier. A power transformer isolates the line from the chassis. No shock hazards. Ideally suited for installations where space is at a premium. The output cable is attached within the tuner to the low output tap. If higher output is desired connect the output cable to the medium or high output as shown in the diagram below.

Specifications:
With a strong signal tuned in –

A.V.C.: – – – – – – – – – – 3-7 volts.

GENERAL

Model 710 tuner chassis described herein, is a high quality AM-FM tuner, designed for connection to any good amplifier, radio or television receiver.

Its small and compact size lends itself to custom installations, remote and numerous other applications.

Because of the fact that in some cabinets the tuner must be mounted in an inverted or upright position, a special dial scale is made available, with dial calibrations from top to bottom. An attractive bronze finished escutcheon is supplied with each tuner.

The tuner does not carry its own power supply and an external source is required. A 3-foot power cable emerging from the rear of the chassis is color coded for easy identification.

DATA ON THE APPROVED FM-AM TUNER

The ever-increasing number of FM stations on the air, and the spiraling demand for high-quality FM reception are a challenge to the ingenuity of circuit engineers who must steer a course between very cheap designs of such poor performance that dealers are coming to recognize them as spurious models, and FM receivers which are too high in price for the mass market at this time.

It was with the middle course in mind that our engineers at Approved Electronic Instrument Corporation designed the unit shown in the circuit diagram.

First of all, it employs a tuned RF stage with two limiters and a discriminator, giving high sensitivity and effective static reduction. These assure reception that does full justice to FM broadcasting. Then, a simplified electrical design was developed which assures high stability and freedom from drift.

This tuner contains all the controls required for operation, and one stage of audio amplification common to both FM and AM section. Thus it can be connected to a special amplifier and speaker, or to the audio system of an existing television set capable of supplying the necessary filament and B+ power requirements of the tuner.

FM - I.F. Section

Following the mixer are two I.F. stages operating at a center frequency of 10.7 mc. into two limiter stages which in turn feed a standard discriminator. All I.F. transformers are constructed for high frequency operations throughout. Special iron cores are used that reach their peak "Q" value at 10.7 mc. The fixed capacitors are of the compensatory type. Wave shape tests have shown these transformers to possess excellent symmetry and stability. The discriminator transformer has been designed to provide extreme uniformity of wave shape with equal positive and negative peaks resulting in high voltage output with very good discrimination. A band width of 200 kc. is the nominal value of all I.F. Discriminator transformers. Fig. 3 and Fig. 4.

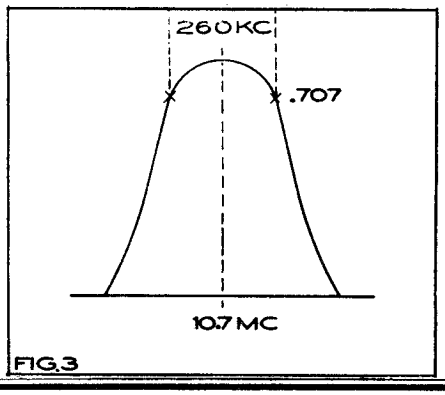

FIG.3

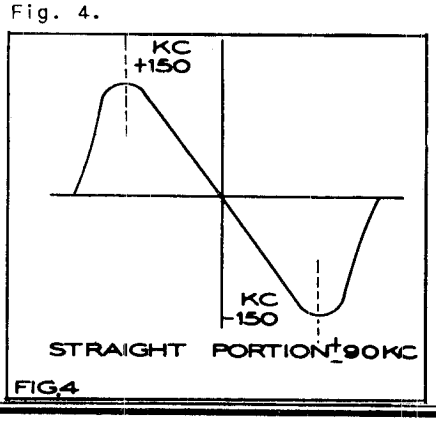

FIG.4

©John F. Rider

MODEL A-710

FM - I.F. Alignment

The center frequency of the IF amplifier is 10.7 mc. Due to overcoupling of the IF transformers a bandwidth of about 150 kc. can be expected and is of the double humped variety. While it is possible to align the IF amplifier with an ordinary AM signal generator and meter, for maximum response, it does not follow that this method produces the correct alignment for proper bandpass characteristic. A much more efficient and time saving procedure of the I.F. amplifier alignment is the visual method requiring a frequency modulated signal generator, an oscilloscope and for double check purposes a deviation meter to be connected across the discriminator output. The meter is a D.C. V.T.V.M. zero center and calibrated -3.-0 +3 volts. The frequency modulated signal generator must be capable of sweeping through a range of about 10.5 to 10.9 mc. in sawtooth fashion with a possible adjustment for contraction or expansion of the total sweep width and a simultaneously generated sweep voltage is necessary for horizontal deflection of the oscilloscope. A good AM signal generator with a wide spread around 10.7 mc. completes the total test instruments necessary for proper IF amplifier alignment. Using the visual method of IF alignment, the sweep voltage output of the frequency modulated signal generator must be connected to the horizontal deflection input of the oscilloscope. The controls of the scope should be adjusted that the trace covers almost the full width of the screen. Connect the vertical deflection input of the oscilloscope across the grid return resistor of the limiter stage and with the output of the frequency modulated signal generator applied to the grid of the second IF stage, adjust the generator to sweep from about 10.5 to 10.9 mc. Due to grid rectification action of the limiter stage, a signal corresponding to the amplitude response of the preceding circuits is then available, and by careful adjustment of the oscilloscope controls a picture of the response curve will be visible on the screen. Never apply more generator voltage than required to produce a good image on the screen.

In order to insure correct center frequency setting, it is now necessary to apply a marker frequency, conveniently obtained from the standard AM signal generator, unmodulated and applied in parallel with the sweep frequency generator. The output of the AM generator should be isolated by means of a small mica condenser and have sufficient R.F. voltage output to produce a small marker pip superimposed upon the response curve trace. With the AM generator set to exactly 10.7 mc. observe the position of the marker pip and if the pip falls in the center of the response curve, the alignment to follow consist of equalizing the peaks on either side of the marker pip by means of the iron core adjustment screws from the top and bottom of the IF transformers. If the AM generator possesses a good frequency spread around 10.7 mc., the marker pip can be used to measure actual band width by slowly moving the AM generators frequency to either side of center frequency, noting where the pip begins to slide off the center of either hump, and adding both frequency differences from center frequency. This equals the total bandwidth. A correct alignment pattern is shown in Fig. 7A. Greater amplitude of patterns indicate higher gain and therefor all adjustments made must be based not only upon symmetry but gain as well.

The generators, both AM and FM are now shifted to the grid of the preceding stage and the whole procedure as outlined repeated. It will be necessary to reduce the output of the generators due to the gain of the added stage. When this stage has been properly aligned, the signal generators are then shifted to the grid of the mixer tube (6C4), where the oscillator voltage is injected. During the alignment of the first IF transformer, the oscillator should be inoperative by removing the 6J6 tube. The next step is to align the first IF transformers prim. and sec. The pattern appearing on the screen is then a picture of the overall response of the complete IF amplifier and should be symmetrical with the highest possible amplitude for maximum gain.

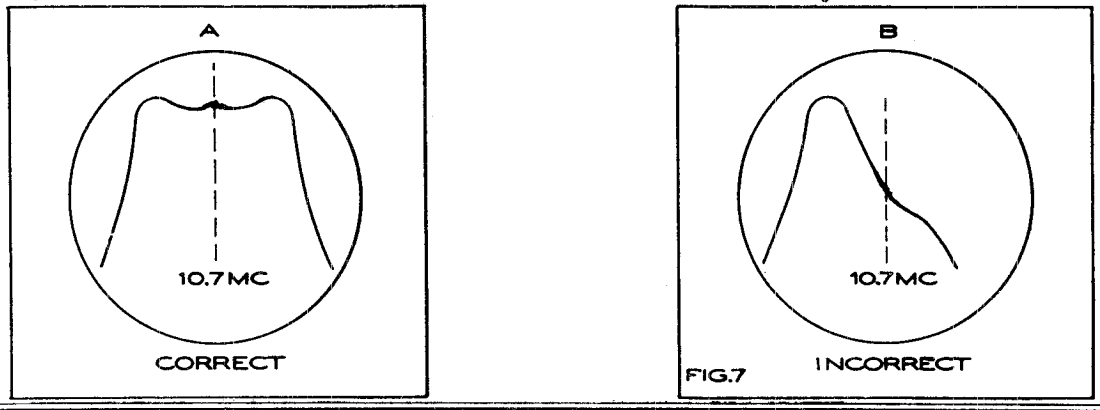

FIG.7

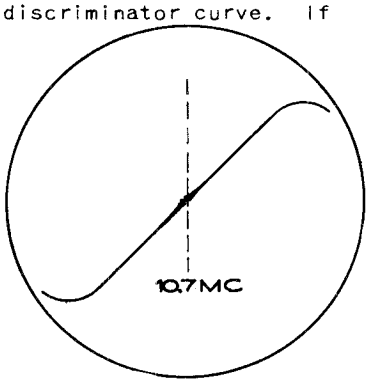
©John F. Rider

Discrimator Alignment

The alignment of the discriminator is comparatively easy. The output of the frequency modulated signal generator is applied to the grid of the 1st limiter tube and the output of the AM generator is fed to the same point at 10.7 mc. The vertical input of the oscilloscope must be connected across the discriminator output with the ground side of the scope to the grounded side of the discriminator. The controls of the scope should be adjusted for the best image possible with a minimum of signal generator voltage applied to the grid of the limiter. Symmetry must be obtained around the 10.7 mc. marker pip with linearity above and below the marker pip point. A correct discriminator pattern is shown in Fig. 8.

The adjustment of the primary of the discriminator transformer controls the linearity of the discriminator curve. If meter alignment is preferred, or no oscilloscope available, a simple D.C. vacuum tube voltmeter preferably one having a zero center scale and reading plus and minus 3 volts is connected across the discriminator output. A frequency of 10.7 mc. from an AM signal generator is fed to the grid of the limiter stage. The meter will probably read off center. The secondary of the discriminator must now be adjusted until the meter reads zero volts. Now change the generators frequency in equal steps above and below 10.7 mc. and note the voltage read on the meter. Readings should increase linearly on either side of the 10.7 mc. center frequency. Checks and rechecks with simultaneous adjustment of the discriminators primary may be necessary before a curve is obtained that resembles the pattern in Fig. 8.



CORRECT DISCRIMINATOR ALIGNMENT PATTERN WITH 10.7 MC MARKER PIP

FIG.8

R. F. Frontend Alignment

To align the RF section of the Approved Tuner the following equipment is required. A signal generator with a frequency coverage of 88-108 mc. and preferably on fundamentals, a D.C. vacuum tube voltmeter with a low scale reading of about 3 volts or a D.C. meter having at least 20,000 ohms per volt impedance. The meter should be connected across the grid return resistor of the limiter stage. The output of the generator is then applied to the input of the tuner with the frequency set to 106 mc. and the tuner dial indicator set to read likewise 106 mc. The next step is to adjust the oscillator trimmer until the meter indicates maximum voltage. If the meter tends to read off scale, reduce the R.F. input voltage and hold the meter reading to about 2 volts average. The oscillator has been designed to operate at 10.7 mc. lower than signal frequency and proper setting of the oscillator frequency can be readily checked with a small absorption type wavemeter. At resonance, a large dip or increase in voltage reading will be noticed. The text adjustment consists of tuning the antenna and mixer stages for maximum response. Like the oscillator, both stages are tuned by means of silver ceramic capacitors.

The generator should now be set to 90 mc. and the dial indicator to the same frequency, and the oscillator, RF and antenna inductance slugs adjusted until the meter again reads maximum voltage. A small adjustment of the oscillator inductance at 90 mc. may show up as a large frequency deviation at 106 mc. due to the inter-relationship of L to C. It may be necessary to repeat the alignment procedure several times before good tracking is finally obtained. With a perfectly aligned tuner, tracking error should never be more than 3 db.

Audio Amplifier

For full enjoyment of high quality reception possible, an amplifier having a flat response of 50-15,000 c.p.s. within 2 db. should be used with a correspondingly good speaker.

Power connection external or from the amplifier to the tuner must be made and a shielded lead from the tuner output must be used to the amplifier inout in order to avoid hum pickup.

Antenna

The input of the Approved Tuner has been designed to accommodate an FM antenna with a 300 ohm downlead impedance. It must be remembered that the higher the antenna above ground the greater its effectiveness. A simple folded di-pole antenna may be constructed from the new type 300 ohm line. For construction information see Fig. 5.

©John F. Rider

MODEL A-710

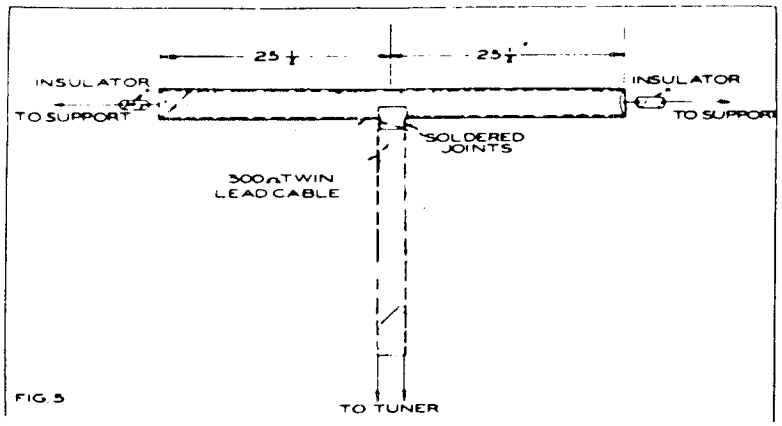


FIG. 5

AM - I. F. Section

Following the converter are two I F transformers operating at 456 Kc. Special ironcore tuned IF transformers of high quality, high "Q" construction contribute to the excellent stability.

AM -I. F. Alignment

The following instruments are required for the complete alignment of the AM receiver section.

1. A signal generator with Audio Modulation covering the 456 Kc. and 540 -1800 Kc. band.
2. Voltmeter (AC) preferably vacuum tube (Voltmeter).

The alignment of the AM section should be as follows:

Connect the AC output meter to the audio terminal from the 6AT6 tube, set meter to a suitable scale, volume control half on, selector switch in AM position.

Connect the signal generator to the converter signal grid and ground and feed in a 456 Kc. signal. Align all IF transformers for maximum meter reading. Use as little generator input as possible. If an amplifier is connected to the tuner use the output meter across the voice coil, modulate signal generator and align for maximum sound output.

AM - R. F. Alignment

Connect the output meter as above and feed a 1450 Kc. signal into the antenna terminals. Check dial pointer to coincide with dial calibrations. Adjust all AM trimmer condensers for maximum output. Use as little generator input as possible.

Set dial pointer to 600 Kc. (generator likewise to 600 Kc.) and adjust ironcore slug of the AM oscillator coil for maximum output. Rock variable condenser slightly back and forth, note output and adjust tuning slug until maximum output is obtained near 600 Kc. Return dial setting to 1450 Kc., generator setting likewise and repeat trimmer adjustment. This procedure may be repeated until no further increase in output is obtained at 1450 Kc. and 600 Kc. Due to the great sensitivity of this tuner, only a small antenna is required for average reception.

To the left of the tuning capacitor is the FM section with the antenna coil located directly between the 6AG5 tube and variable capacitor. Directly behind the antenna coil follows the mixer coil and tube and this is followed by the oscillator tube and coil. All three coils are slug tuned and these slugs are used for inductance adjustment around 90 Mc. only. Temperature compensated silver ceramic trimmer condensers are shunted across the main tuning sections and are used for high frequency adjustment around 106 Mc. only. All FM alignments are critical and must be made with great care in order to obtain the maximum performance of which the tuner is capable. Model 710 has been aligned at the factory by the sweep generator and scope method for maximum efficiency and no adjustments should be disturbed unless the service man has the necessary tools to perform alignment service. Approved Electronic Instrument Corp. sweep generator Model A-400 is a Sweep generator ideally suited for FM and television alignments.

Page 7 shows a tube layout. The top view of the tuner shows clearly all important parts and are identified as to their function. To the right of the tuning condenser and located near the dial scale is the AM antenna coil. Directly in line, but under the chassis is the AM-RF coil. These coils are fixed and have no other adjustment but the trimmers on the variable capacitor. Again in line and under chassis is the AM oscillator coil. This coil has an ironcore slug and its adjustment is rather critical and should only be used and adjusted around 600 Kc. To the right of the chassis are located the IF tubes and 456 Kc. IF transformers.

In good signal areas where fairly strong FM signals are available, an indoor antenna as described on page 5 will work satisfactorily; however, for maximum performance an outdoor dipole with 300 ohm line is strongly recommended. For those who intend to use the tuner in conjunction with a television receiver, we recommend a simple 2 pole knife switch arrangement to transfer the television antenna to the tuner, using the same antenna for either television or FM reception.

TECHNICAL AND ALIGNMENT DATA FOR FMF-3 TUNER

The tuning slugs used in our tuners have a nominal operating range from 87.5 to 108.5 megacycles. They are held within 1% tolerance in permeablity. The oscillator operates 10.7 megacycles higher in frequency than the signal. This means that the effective permeability of the tuning slug is greater in the oscillator coil than in the signal coils. Some method, therefore, is required to reduce the actual frequency coverage of the oscillator. This is done by means of a coil in shunt with the oscillator coil which reduces the latters frequency coverage to agree with the signal coils. The inductance of this coil is made adjustable by meansof an iron core. Frequency stability of the oscillator through careful design and the use of capacitors of the proper temperature co-efficient is equalled only by the use of crystal controlled circuits.

The mixer circuit is of purely conventional design. Oscillator voltage is injected directly into the grid of the mixer by a .68 mmf. capacitor from the oscillator plate.

The RF stage consists of a cathode follower-grounded grid amplifier. At VHF this type of circuit offers a considerable advantage over the more conventional pentode stage. The loading effect of the tube on the coil is many times less than a pentode at these high frequencies. Consequently the "Q" of the circuit is improved which increases both the sensitivity and the image ratio.

ALIGNMENT INSTRUCTIONS

It is necessary that an accurately calibrated signal generator be employed that covers the range of 86 to 109 mc. It should be frequency modulated but not necessarily so. It will be assumed that the alignment work is being done in a completed FM radio with some kind of tuning indicator on it. The following table lists the operations to be performed:

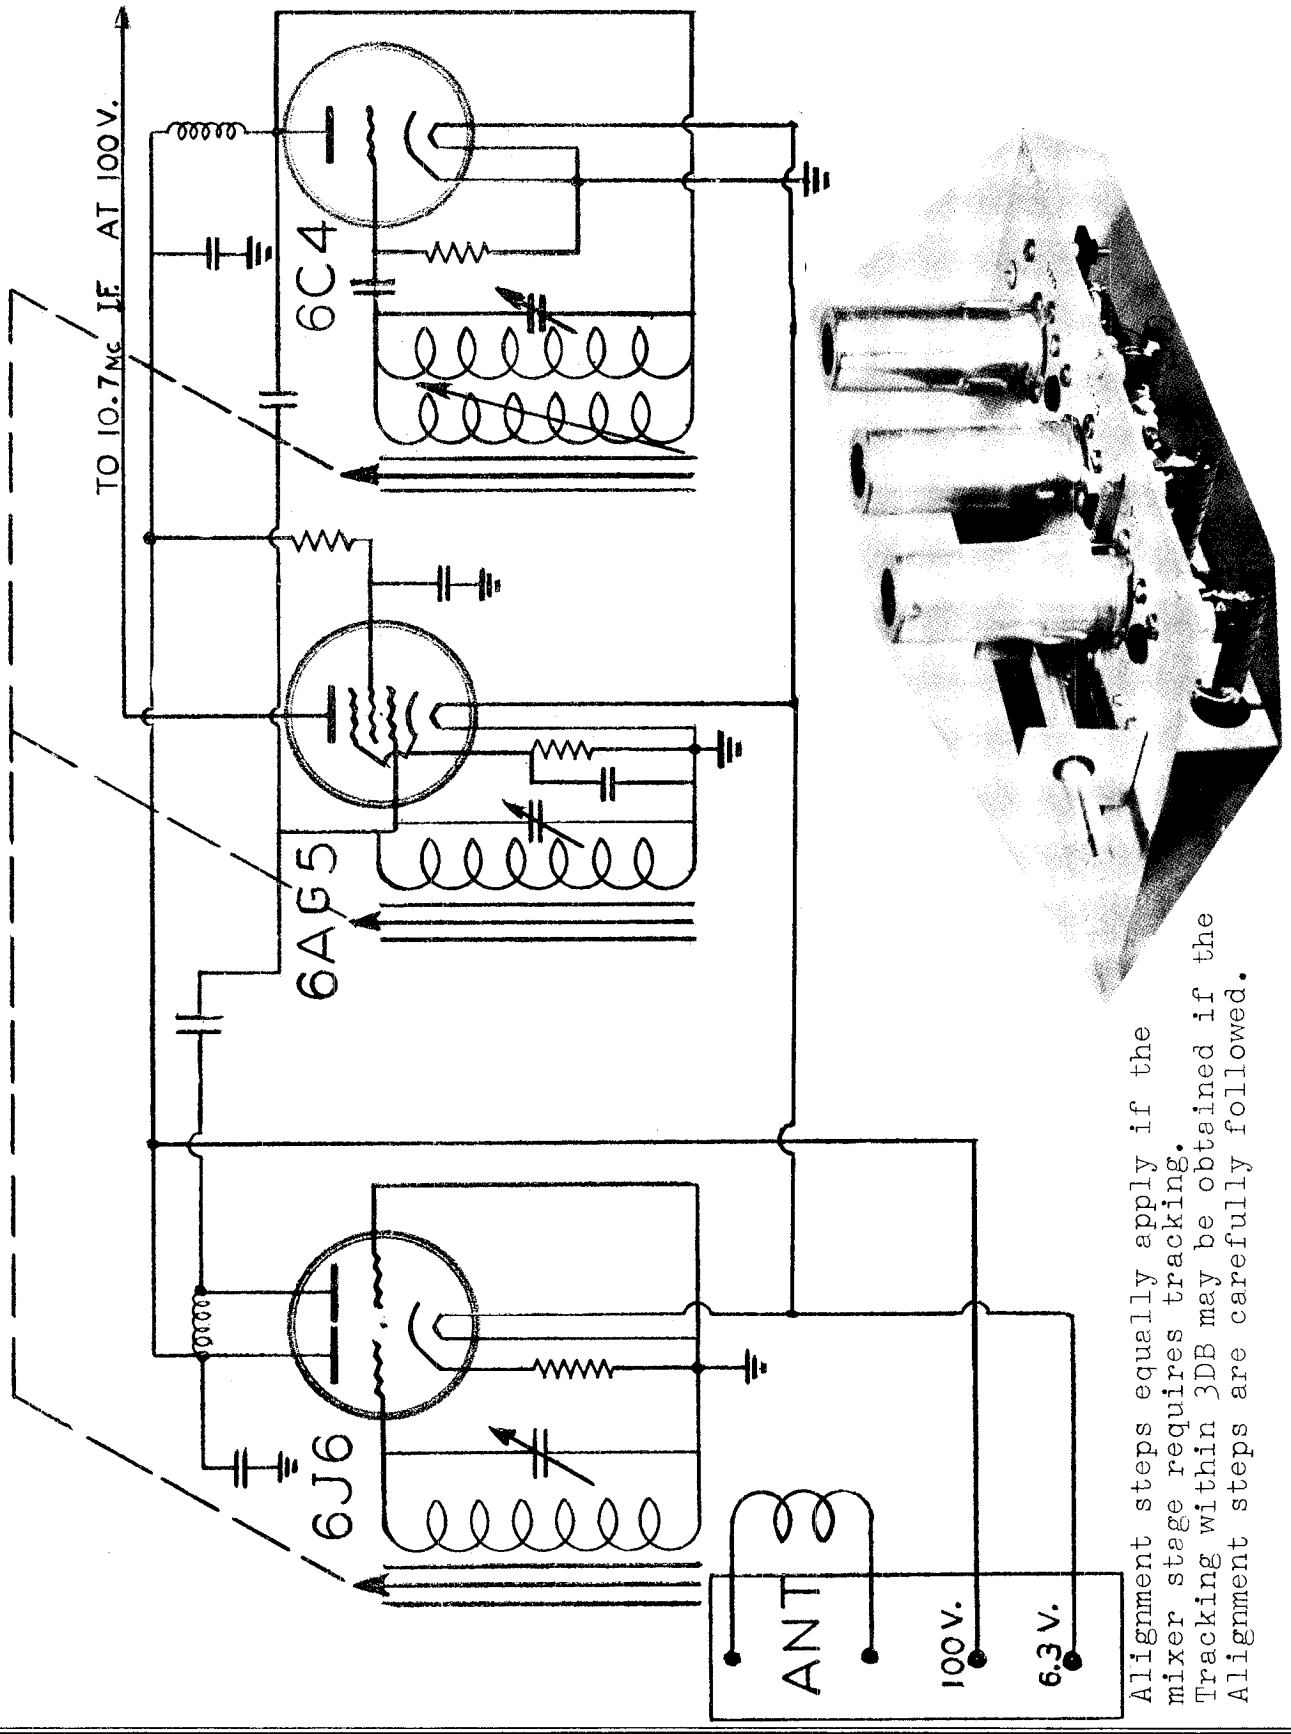
1. Set oscillator tuning slug to 1/32" from end of winding with tuning slugs all the way out .
2. Connect the signal generator through a .1mfd. condenser to the grid of the mixer tube. Remove RF tube.
3. Set the signal generator to 87.5 mc. and run the tuning slugs all the way in the coils.
4. With an insulated screwdriver adjust the oscillator trimmer until a signal is heard. Make sure that the oscillator is on the high side of the signal by swinging thesignal generator to 108.9 mc. T he image should be heard practically as loud as the signal was. If the image is not heard the oscillator trimmer should be re-adjusted by reducing the capacity ofthe trimmer until another signal isheard. The proper setting will be with the screwdriver slot at approximate right angles with the front of the tuner.
5. Run the tuning slugs all of the way out of the coils and check the frequency. If the coverage is too great unscrew t he shunt coil core two or three turns and repeat steps three and four. If too narrow screw the shunt core in two or three turns and repeat steps three and four. This may have to be repeated several times until proper coverage is obtained. The oscillator trimmer will have to be adjusted each time this is done. The tuning range now should be 88.5 to 108.5 megacycles.
6. Remove signal generator lead from mixer grid and connect it to the antenna. Insert RF tube.
7. Set mixer tuning core to 1/32" f rom end of winding with the tuning slugs all the way out. Adjust mixer trimmer for maximum output.
8. Set RF tuning core flush with end of winding with slugs all the way out. Adjust RF trimmer for maximum output.
9. Set signal generator to 106 megacycles, tune in the signal, and re-adjust the RF and mixer trimmers for maximum output.
10. Set signal generator to 90 megacycles, tune in the signal, and check alignment by adjusting the RF and mixer trimmers to see if they are at optimum alignment. If circuits do not track do the following:

a. If the RF trimmer has to be screwed in at 90 megacycles to obtain tracking, screw the RF tuning slug in about 1 turn, and repeat steps 9 & 10 until tracking is obtained.

b. If the RF trimmer has to be screwed out at 90 megacycles to obtain t racking, screw the RF tuning slug out about 1 turn & repeat steps 9 & 10 until tracking is obtained.

©John F. Rider

MODEL FMF-3 Tuner



Alignment steps equally apply if the mixer stage requires tracking.
Tracking within 3DB may be obtained if the Alignment steps are carefully followed.

©John F. Rider

MODEL M-90 AUTO RADIO INSTALLATION

Due to the compact size of this receiver, many mounting positions are possible. However, the most convenient is directly below the instrument panel as illustrated in figure 1. The following step by step procedure will facilitate the installation of the receiver.

1. With the receiver itself as a model, select the desired position.

2. Using the front mounting bracket as a template, locate the two front mounting holes and drill a ¼" hole at each point.

3. Attach front mounting bracket to the receiver by two No. 6 self-tapping screws.

4. Locate the position for the rear mounting stud in the bulkhead and drill a ½" hole.

5. With the stud mounted on the receiver and the inside nut and washer in place, insert the stud through the bulkhead hole and attach the front end of the receiver to the instrument panel with the small screws provided for that purpose.

6. Open the engine compartment and remove the paint on the bulkhead around the stud. Assemble the washer and nut on this side and adjust both this nut and the inside nut for perfect alignment of the receiver and for good contact with the brightened surface of the bulkhead.

Caution: Do not screw stud in case beyond point necessary to insure support, otherwise, it may penetrate rear wall of case and cause damage to the instrument.

7. Attach the terminal of the "A" battery cable to one of the posts on the ammeter, preferably on the battery side. This may be ascertained by switching the receiver on. If no deflection of the ammeter occurs, the receiver is properly connected.

8. Insert plug on the end of the antenna lead into socket connector located on the left side of the radio.

Motor Noise Elimination

1. Disconnect the center lead in the distributor head of the motor and insert a "distributor suppressor" in the cavity and then place the lead in the top receptacle of the suppressor.

2. Clamp a "generator condenser" under the screw which mounts the cut-out on the generator. Connect the flexible terminal of the condenser to the lead on the cut-out.

Operation

Volume Control Knob — This knob is located on the right side of the radio. Turning this knob slightly to the right until a slight click is heard will put the radio into operation. Turning this knob further to the right will increase the volume and turning it to the left will decrease the volume. After a station has been selected, the volume control should be adjusted to the required loudness. The volume should never be reduced by detuning the station selector knob.

Station Selector Knob — This knob is located on the left side of the radio. This knob should be turned until a desired station has been selected. Adjust this knob very carefully until the station comes in with the most natural tone.

MODEL M-92C AUTO RADIO
with built-in
BATTERY CHARGER
and
ELECTRIC SHAVER POWERIZER

INSTALLATION AND OPERATING INSTRUCTIONS

This radio is equipped with a patented built-in storage battery charger. A "run-down" storage battery can be recharged **without removing the battery from the car** or making any direct connection to the battery. One end of a power line cord is plugged into a connector on the radio and the other end is inserted into any convenient 117 Volt AC receptacle.

A "Powerizer" has been built into this radio as an extra added feature for the vacationist or traveler. It is possible to operate a standard 117 volt electric razor from this "Powerizer" with the automobile storage battery as the original source of power.

IMPORTANT

READ CAREFULLY BEFORE INSTALLING RADIO IN ANY CAR

Polarity Reversing Switch

Since the polarity of the grounded battery terminal is not the same in all types of cars, this instrument is equipped with a Polarity Reversing Switch.

The position of this switch has no effect on the normal operation of the radio but it must be in the correct position for battery charging.

The switch is located on top of the radio. It should be adjusted to the correct position before installation.

Slide switch to "—GND" position for cars with the negative battery terminal grounded.

Slide switch to "+GND" position for cars with the positive battery terminal grounded.

Refer to the chart below to determine the polarity of the grounded battery terminal in the car in which the radio is to be installed.

MODEL M-92C

INSTALLATION

Due to the compact size of this receiver, many mounting positions are possible. However, the most convenient is directly below the instrument panel as illustrated in figure 1. The following step by step procedure will facilitate the installation of the receiver.

1. With the receiver itself as a model, select the desired position.

2. Using the front mounting bracket as a template, locate the two front mounting holes and drill a ¼" hole at each point.

3. Attach front mounting bracket to the receiver by two No. 6 self-tapping screws.

4. Locate the position for the rear mounting stud in the bulk head and drill a ½" hole.

5. With the stud mounted on the receiver and the inside nut and washer in place, insert the stud through the bulkhead hole and attach the front end of the receiver to the instrument panel with the small screws provided for that purpose.

6. Open the engine compartment and remove the paint on the bulkhead around the stud. Assemble the washer and nut on this side and adjust both this nut and the inside nut for perfect alignment of the receiver and for good contact with the brightened surface of the bulkhead.

Caution: Do not screw stud in case beyond point necessary to insure support, otherwise, it may penetrate rear wall of case and cause damage to the instrument.

7. Attach the terminal of the "A" battery cable to one of the posts on the ammeter, preferably on the battery side. This may be ascertained by switching the receiver on. If no deflection of the ammeter occurs, the receiver is properly connected.

8. Insert plug on the end of the antenna lead into socket connector located on the left side of the radio.

Motor Noise Elimination

1. Disconnect the center lead in the distributor head of the motor and insert a "distributor suppressor" in the cavity and then place the lead in the top receptacle of the suppressor.

2. Clamp a "generator condenser" under the screw which mounts the cut-out on the generator. Connect the flexible terminal of the condenser to the lead on the cut-out.

OPERATION

"Charge-Radio" Switch

This switch is centrally located just below the tuning dial. Slide this switch to the right for normal radio operation and to the left for battery charging.

Volume Control Knob — This knob is located on the right side of the radio. Turning this knob slightly to the right until a slight click is heard will put the radio into operation. Turning this knob further to the right will increase the volume and turning it to the left will decrease the volume. After a station has been selected, the volume control should be adjusted to the required loudness. The volume should never be reduced by detuning the station selector knob.

Station Selector Knob — This knob is located on the left side of the radio. This knob should be turned until a desired station has been selected. Adjust this knob very carefully until the station comes in with the most natural tone.

©John F. Rider

Battery Charging

A "run-down" storage battery can be charged in the following manner:

1. Slide switch, located on the front of the radio, to the "CHARGE" position.
2. Insert female connector of "Radio Cord" into socket located below speaker grill.
3. Insert other end of cord into any convenient 117 Volt AC power receptacle.

The length of time required for a charge is dependent entirely on the condition of the battery being charged. An overnight charge will usually be sufficient if the battery is only slightly run down.

ELECTRIC SHAVER POWERIZER

The "Electric Shaver Powerizer" can be operated by connecting an adaptor to the same cord as used for battery charging.

Electric Shaver Operation

1. Insert one end of "Radio Cord" into socket under speaker grill. (Same socket as used in battery charging.)
2. Plug other end of "Radio Cord" and Electric Shaver into "Powerizer Adaptor."
3. Keep front switch in "Radio" position.
4. Turn set on.
5. Start shaver immediately.

A disturbance similar to static will normally be heard through the loud speaker while the razor is being used. The volume control should be turned back until the disturbance is no longer heard.

MODEL X-50 AUTO RADIO

Due to the compact size of this receiver, many mounting positions are possible. However, the most convenient is directly below the instrument panel as illustrated in figure 1. The following step by step procedure will facilitate the installation of the receiver.

1. With the receiver itself as a model, select the desired position.

2. Using the template on the bottom of this page, locate the two front mounting holes and drill a ¼" hole at each point.

3. Locate the position for the rear mounting stud in the bulkhead and drill a ½" hole.

4. With the stud mounted on the receiver and the inside nut and washer in place, insert the stud through the bulkhead hole and attach the front end of the receiver to the instrument panel with the small screws provided for that purpose.

5. Open the engine compartment and remove the paint on the bulkhead around the stud. Assemble the washer and nut on this side and adjust both this nut and the inside nut for perfect alignment of the receiver and for good contact with the brightened surface of the bulkhead.

Caution: Do not screw stud in case beyond point necessary to insure support, otherwise, it may penetrate rear wall of case and cause damage to the instrument.

6. Attach the terminal of the "A" battery cable to one of the posts on the ammeter, preferably on the battery side. This may be ascertained by switching the receiver on. If no deflection of the ammeter occurs, the receiver is properly connected.

7. Insert plug on the end of the antenna lead into socket connector located on the left side of the radio.

Motor Noise Elimination

1. Disconnect the center lead in the distributor head of the motor and insert a "distributor suppressor" in the cavity and then place the lead in the top receptacle of the suppressor.

2. Clamp a "generator condenser" under the screw which mounts the cut-out on the generator. Connect the flexible terminal of the condenser to the lead on the cut-out.

Operation

Volume Control Knob — This knob is located on the right side of the radio. Turning this knob slightly to the right until a slight click is heard will put the radio into operation. Turning this knob further to the right will increase the volume and turning it to the left will decrease the volume. After a station has been selected, the volume control should be adjusted to the required loudness. The volume should never be reduced by detuning the station selector knob.

Station Selector Knob — This knob is located on the left side of the radio. This knob should be turned until a desired station has been selected. Adjust this knob very carefully until the station comes in with the most natural tone.

ALIGNMENT PROCEDURE

Broadcast Band Section I. F. and R. F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of .50 watts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.25 volts AC across this resistor will be approximately equivalent to .50 watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, AC, 60-cycles; Chassis only 75 watts. With phono operation 100 watts.

Frequency Ranges.....Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.

Intermediate Freq....AM-455 kc.; FM-10.7 mc.

Selectivity.....AM-43 kc. broad at 1000 times signal, measured at 1000 kc. I.F. FM-250 kc. broad at 2 times down. I.F. FM-650 kc. broad at 10 times down.

AM Sensitivity.....(For .5 watt output with external antenna)—18 microvolts average.

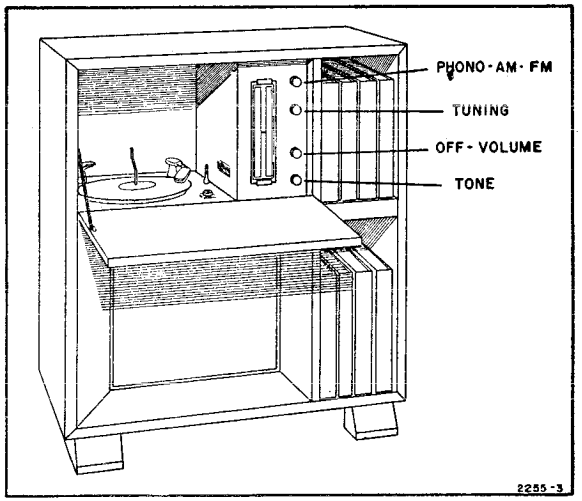
FM Sensitivity.....(For .5 watt output)—16 microvolts average.

Power Output.....2 watts, 10% distortion. 4 watts maximum.

Loud Speaker.....10" PM. Voice coil impedance 3.2 ohms, 400 cycles.

Tube Complement.....
12AT7, FM-RF amp. mixer;
12BA7, AM converter, FM oscillator;
12BA6, IF amplifier;
12AU6, FM driver;
12AL5, FM detector;
12AV6, AM detector, AVC, 1st audio;
50L6GT, output.

Automatic Changer See Manual 5078A.



MODEL A-7AF21,
Series A

ALIGNMENT PROCEDURE

FM Band Section I. F. and R. F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube voltmeter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM — I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 12AU6	Pin No. 7 of 12AL5 and B minus	Bottom Core Primary of T9 Ratio Detector	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 12AU6	See nofe "A"	Top Core Secondary of T9 Ratio Detector	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 330 microvolts	Pin No. 1 of 12BA6	Pin No. 7 of 12AL5 and B minus	Primary and Secondary of T7. FM Driver IF See chassis view.	Resonance should be about 3 volts
10.7 Mc. Use about 600 microvolts	Top end of C2-C	Pin No. 7 of 12AL5 and B minus	Primary and Secondary of T5. Input IF See chassis view.	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A"—Connect two resistors in series, 100K OHMS each, from Pin No. 7 of 12AL5 to B minus (pin no. 5). These resistors must be matched within 5%. Connect vacuum tube voltmeter between the midpoint of the resistors and point zz.

NOTE "B"—If T9 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

NOTE "C"—To use a VTVM which does not have the "floating ground" feature, in step 2 above, connect "ground" side of VTVM to midpoint of resistors (Note "A") and "high" side to point zz.

GENERAL—Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM — R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of dial marker at the extreme right when gang is closed.

For Adjustment, see dial mechanism illustration.

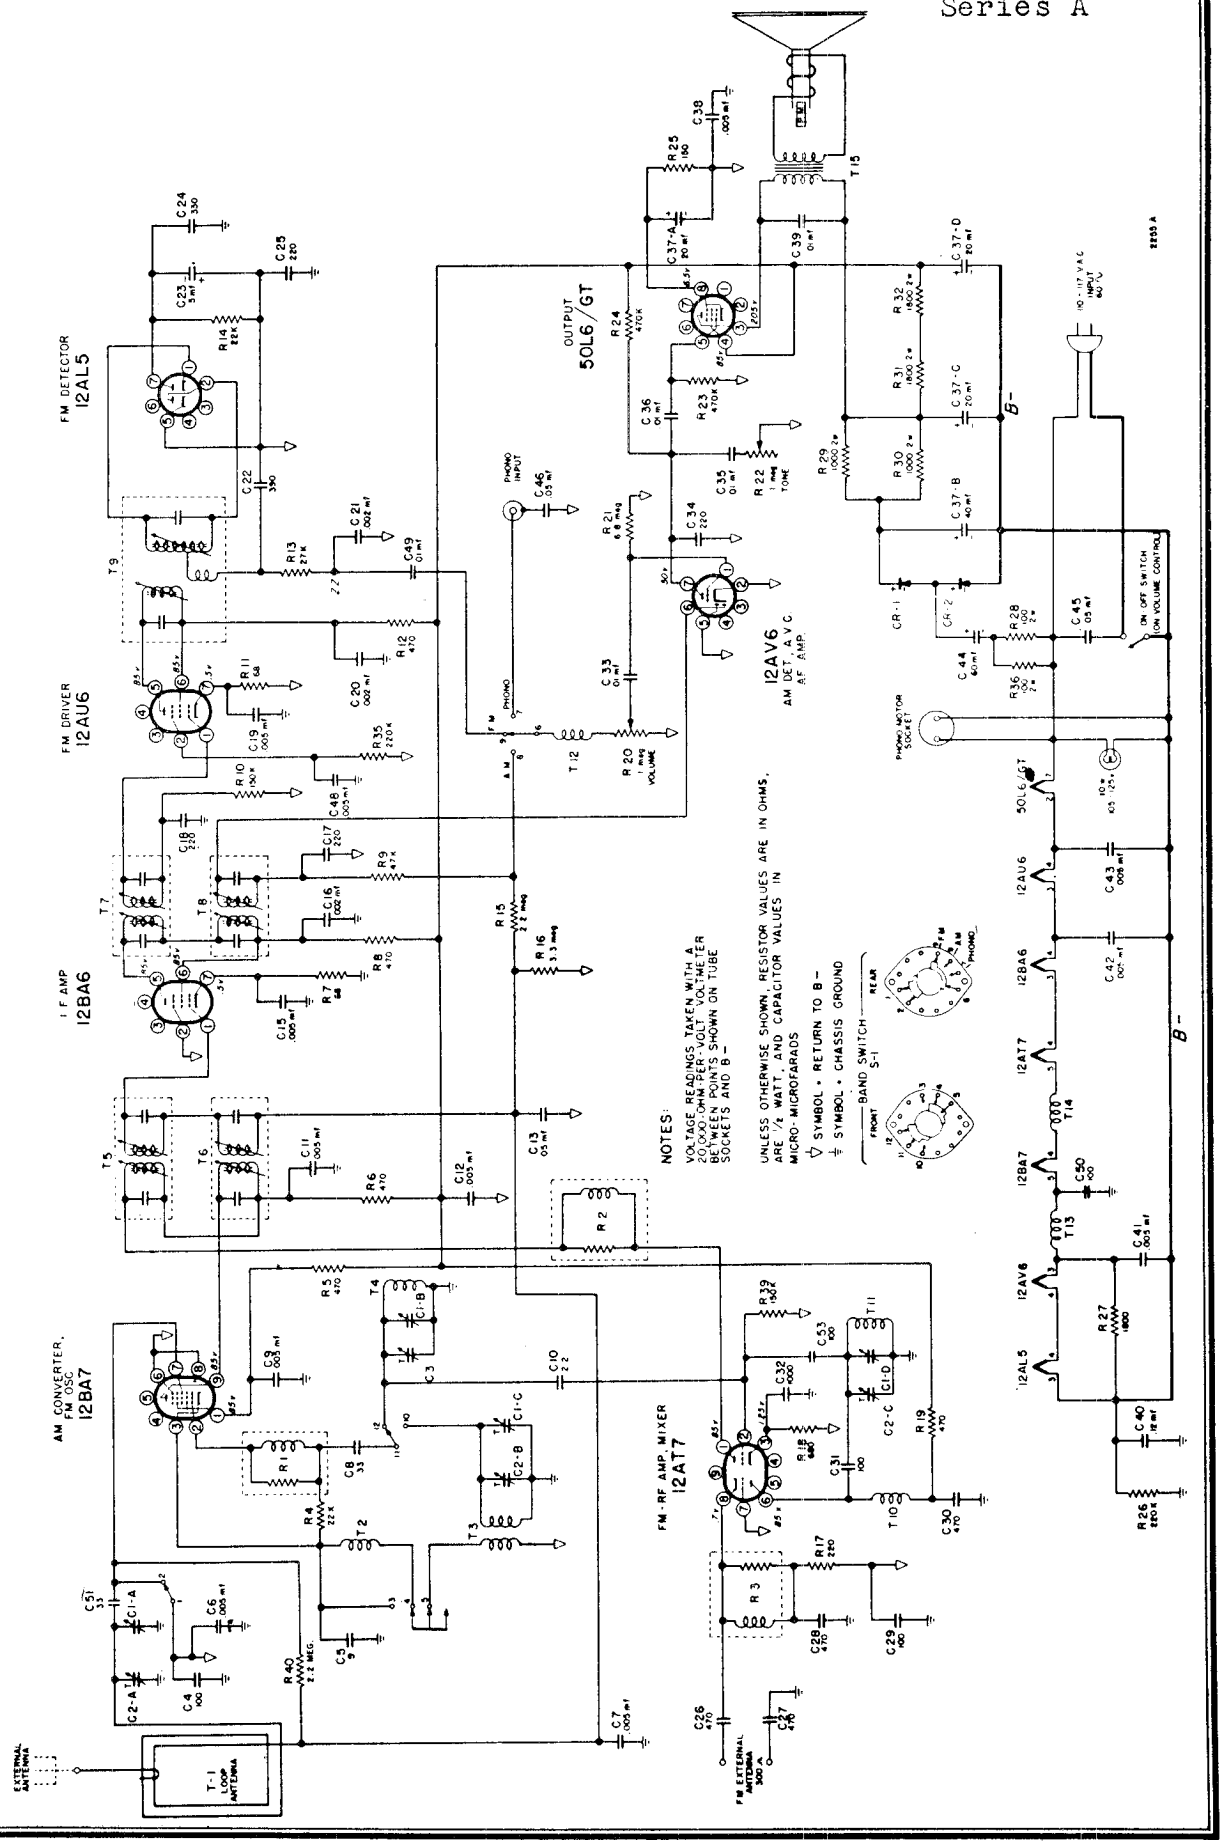
SIGNAL GENERATOR FREQUENCY	POINTER	CONNECTION TO RADIO	ADJUST	V T V M CONNECTIONS
108 MC.	108 MC. Marker	FM antenna terminals	FM Osc C3 for maximum	Pin No. 7 of 12AL5 to B minus
98 MC.	Tune in Gen. Signal	See Note "B" below	FM Mixer C2-C for maximum	

NOTE "A"—If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE "B"—Connect 300 ohms in series with "hot" side of generator and connect to left hand screw of external FM Antenna Terminals. Connect cold side of generator to right hand screw.

© John F. Rider

MODEL A-7AF21,
Series A



NOTE: R7 returns to B minus instead of chassis.
NOTE: Resistor R27 is omitted.
NOTE: A 330 mmf condenser, Part C-8F3-11, is added between B minus and chassis at the Phono Motor socket.
NOTE: 100 mmf condenser, Part C-8G-11734, added between B minus and junction of R15-R16.

MODEL A-7AF21, Series A

REPLACEMENT OF DIAL CORDS

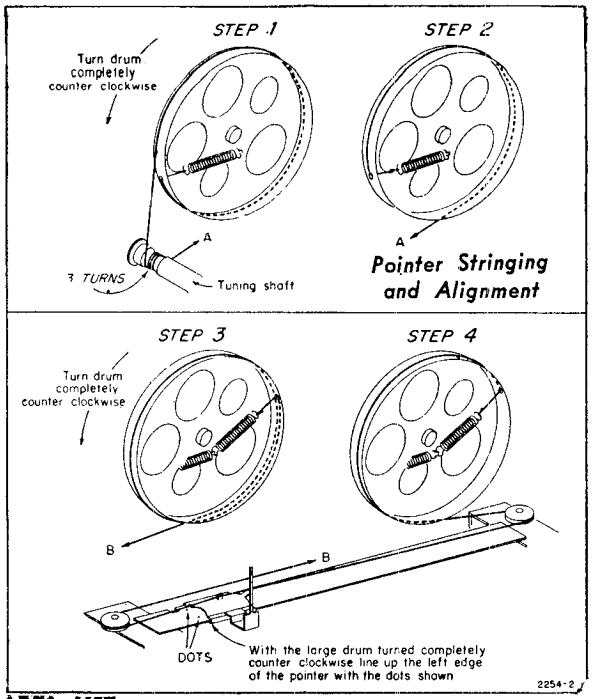
GENERAL—A dual track drum pulley and two individual cords are used on this model.

The rear track carries the Drive String (see Fig. 1 and 2) while the front track carries the Pointer String (see Fig. 3 and 4).

DRIVE STRING: Using approximately 20 inches of dial cord, fasten one end to the tension spring and pass around drum and drive shaft (Fig. 1). Continue cord around drum and pass through hole in rear track (see Fig. 2). Tie end of cord to spring so that spring is extended 1/4 inch.

POINTER STRING: Use approximately 40 inches of dial cord, fasten one end to tension spring and pass around drum pulley (see Fig. 3). Continue cord (Fig. 4) from point B around idler pulleys, around drum, then pass through hole in front track, and tie cord to tension spring so that the spring is extended 1/4 inch.

POINTER CALIBRATION: Adjust pointer as shown in Fig. 4, then loop Pointer string once around upright ear on Pointer carriage.



Pointer Stringing and Alignment

APPLYING POWER TO RADIO

This receiver, unless otherwise marked must be operated on an AC voltage of 105 to 125 volts, 50 to 60 cycles, or on a DC voltage of 105 to 125 volts. If you are in doubt as to the voltage of your power supply, consult your local power company. Receivers of this same model which are for use on voltages other than those specified above are so marked.

BROADCAST BAND

This is the tuning band in which the standard broadcast stations operate. The upper scale on the dial covers the broadcast range of 535-1620 Kc., and is calibrated in channel numbers. To obtain the kilocycle reading, multiply the number on the dial by 10; thus 80 on the dial corresponds to 800 kilocycles.

FM ANTENNAS

The noise-reducing capabilities of FM are noticeably greater when strong FM signals are obtained. Therefore, we recommend, whenever expedient, the use of an outside "folded dipole" aerial with a 300-ohm line lead-in. The aerial must be carefully installed according to the directions furnished with it. The radio is shipped from the factory with the built-in FM aerial connected by means of the long jumper wire to the left-hand FM Antenna Terminal. (See Chassis view).

IMPORTANT: The built-in Antenna is part of the line cord and, therefore, should be fully extended. Changing the angle of drop of the line cord will IMPROVE RECEPTION. If HUM is objectionable reverse the line cord plug in the power receptacle. Select the position giving least amount of hum.

To connect the lead-in from the outside FM aerial, remove the wire from the built-in FM antenna and connect the twin lead-in wire to the two screws. Either wire of the twin lead-in may be connected to either screw. A ground connection is not required for FM reception.

It should be remembered in conjunction with the erection of an FM folded dipole aerial that the signal strength from an FM transmitting station is less and less at greater distances from the transmitter and that FM reception is hardly ever possible beyond "line of sight" distances between transmitting and receiving aerials. This maximum limit is usually about 45 miles but consistently satisfactory reception is frequently limited to 30 miles or less depending on the height of transmitting and receiving aerials and the intervening terrain.

REPLACEMENT OF DIAL CORDS

REPLACEMENT OF DIAL CORDS

GENERAL—A dual track drum pulley and two individual cords are used on this model.

The rear track carries the Drive String (see Fig. 1 and 2) while the front track carries the Pointer string (see Fig. 3 and 4).

DRIVE STRING: Using approximately 20 inches of dial cord, fasten one end to the tension spring and pass around drum and drive shaft (Fig. 1). Continue cord around drum and pass through hole in rear track (see Fig. 2). Tie end of cord to spring so that spring is extended ¼ inch.

POINTER STRING: Use approximately 40 inches of dial cord, fasten one end to tension spring and pass around drum pulley (see Fig. 3). Continue cord (Fig. 4) from point B around idler pulleys, around drum, then pass through hole in front track, and tie cord to tension spring so that the spring is extended ¼ inch.

POINTER CALIBRATION: Adjust pointer as shown in Fig. 4, then loop Pointer string once around upright ear on Pointer carriage.

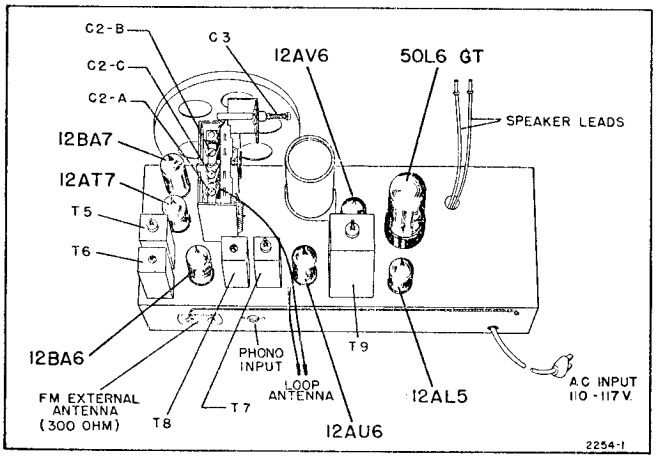
Series A

ALIGNMENT PROCEDURE

Broadcast Band Section I. F. and R. F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of .40 volts AC across this resistor will be approximately equivalent to 50 milliwatt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.



Chassis View

MODEL A-7DF21,
Series A

ALIGNMENT PROCEDURE

FM Band Section I. F. and R. F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube voltmeter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM-I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	*CONNECTION TO RADIO*	*VACUUM TUBE VOLT METER CONNECTION TO RADIO*	*ADJUSTMENTS TO BE MADE*	*ADJUST FOR*
10.7 Mc. Use about .1 volt	Pin No. 1 of 12AU6	Pin No. 7 of 12AL5 and B minus	Bottom Core Primary of T9 Ratio Detector	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 12AU6	See note "A"	Top Core Secondary of T9 Ratio Detector	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 330 microvolts	Pin No. 1 of 12BA6	Pin No. 7 of 12AL5 and B minus	Primary and Secondary of T7. FM Driver IF See chassis view.	Resonance should be about 3 volts
10.7 Mc. Use about 600 microvolts	Top end of C2-C	Pin No. 7 of 12AL5 and B minus	Primary and Secondary of T5. FM Input IF See chassis view.	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A"—Connect two resistors in series, 100K OHMS each, from Pin No.7 of 12AL5 to B minus (pin no. 5). These resistors must be matched within 5%. Connect vacuum tube voltmeter between the midpoint of the resistors and point zz.

NOTE "B"—If T9 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

NOTE "C"—To use a VTVM which does not have the "floating ground" feature, in step 2 above connect "ground" side of VTVM to midpoint of resistors (Note "A") and "high" side to point zz.

GENERAL—Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a resonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R.F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of dial marker at the extreme left when gang is closed. For Adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	*POINTER*	*CONNECTION TO RADIO*	*ADJUST*	*V T V M CONNECTIONS*
108 MC.	108 MC. Marker	FM antenna terminals	FM Osc C3 for maximum	Pin No. 7 of 12AL5 to B minus
98 MC.	Tune in Gen. Signal	See Note "B" below	FM Mixer C2-C for maximum	

NOTE "A"—If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE "B"—Connect 300 ohms in series with "hot" side of generator and connect to left hand screw of external FM Antenna Terminals. Connect cold side of generator to right hand screw.

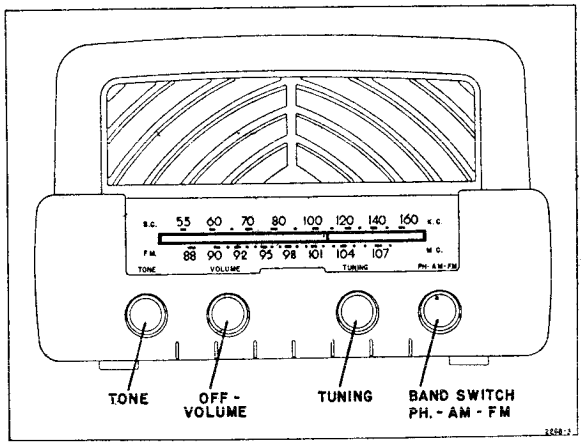
MODEL A-7DH21, Series A



APPLYING POWER TO RADIO—This receiver, unless otherwise marked must be operated on an AC voltage of 105 to 125 volts, 50 to 60-cycles.

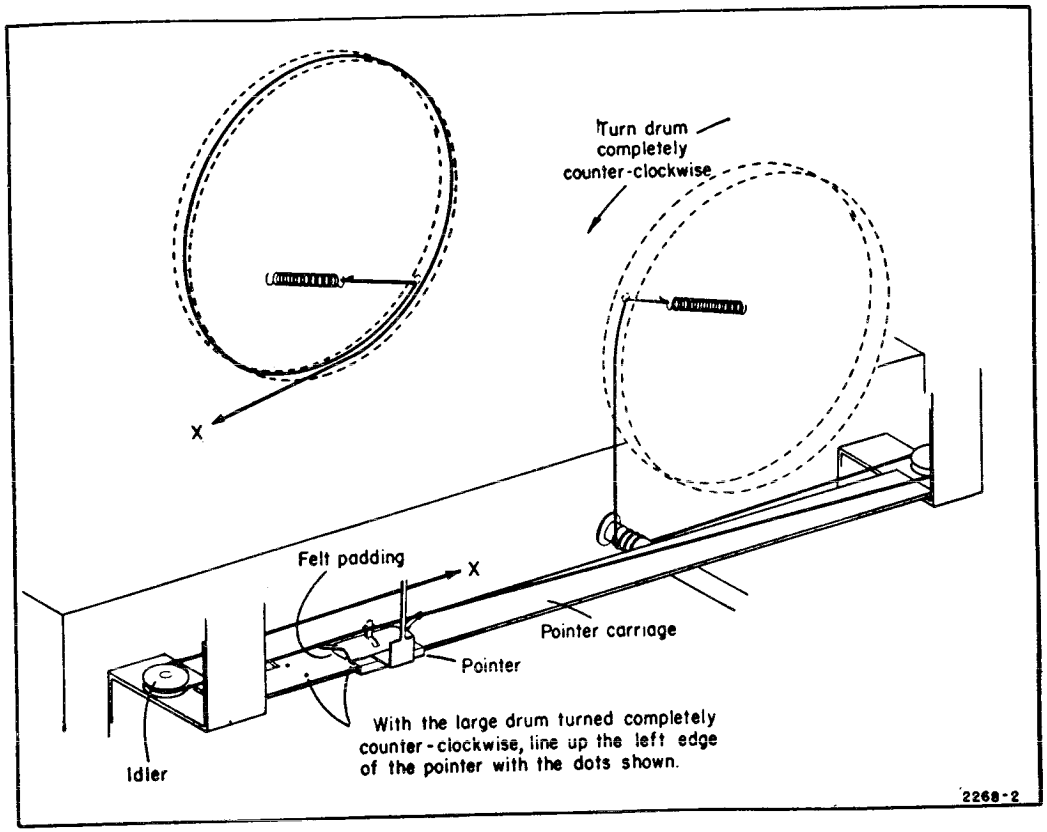
BROADCAST BAND—This is the tuning band in which the standard broadcast stations operate. The upper scale on the dial covers the broadcast range of 535-1620 Kc., and is calibrated in channel numbers. To obtain the kilocycle reading, multiply the number on the dial by 10; thus 80 on the dial corresponds to 800 kilocycles.

FM BAND—The FM tuning range covers the newly allocated frequency-modulation band of 88 to 108 megacycles into which all FM stations are required to move. Check with your local newspaper to determine the frequency of your local FM stations.

ON-OFF SWITCH AND VOLUME CONTROL—The knob second from the left is both the on-off switch and the volume control. When this control is turned all the way to the left the set is off. A slight rotation to the right will click the switch and turn the set on. The knob may then be used to regulate the volume. Be sure your set is turned completely off when not in use; otherwise the tubes will wear out unnecessarily.

TONE CONTROL—Rotating the extreme left hand knob gives a full variation of the tonal response from a deep bass to a brilliant treble.

REPLACEMENT OF DIAL CORDS



Pointer Stringing and Alignment

TUNING KNOB—The knob second from the right is the tuning knob; rotation of this knob moves the indicator along the dial scales. When selecting a station turn the knob back and forth until the tone is clearest and loudest. Do not use the tuning knob to regulate volume; the volume control should be used for that purpose after the station has been tuned in properly. It is particularly important in FM reception to tune the station accurately; otherwise the tone is distorted and the background noise not eliminated.

BAND SWITCH—The knob on the extreme right is used to select FM BAND, BROADCAST BAND, or PHONO. When this knob is turned fully clockwise FM programs can be tuned in. In the center position STANDARD BROADCASTS can be heard.

PHONOGRAPH—To PLAY RECORDS through this radio, connect the "pickup lead" wire from record player to the "PHONO INPUT" on the cabinet back. Turn Bandswitch to PHONO and adjust volume as required.

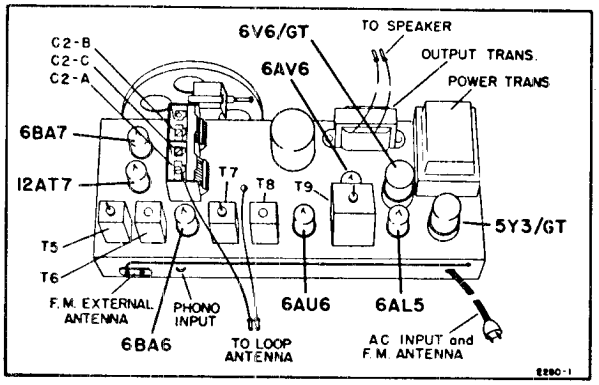
©John F. Rider

ALIGNMENT PROCEDURE

Broadcast Band Section I. F. and R. F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of 500 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.27 volts AC across this resistor will be approximately equivalent to 500 milliwatt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.



Chassis View

AM—I. F. ALIGNMENT

Band Switch in AM Position, Gang Open, Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
400 cycles. Use 65 millivolts	High Side of Volume Control and chassis	None	Maximum output Should be 500 Milliwatts
455 Kc. Use 3300 microvolts	Pin 1 of 6BA6 I.F. Amp. and chassis	Primary and Secondary of T8. See chassis view.	Maximum output Should be 500 Milliwatts
455 Kc. Use 55 microvolts	Pin 7 of 6BA7 Converter and chassis	Primary and Secondary of T6. See chassis view.	Maximum output Should be 500 Milliwatts

BROADCAST BAND—R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of dial marker at the extreme left when gang is closed.
For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	SET POINTER AT	CONNECT TO RADIO	ADJUST
1620 Kc.	Extreme Right Calibration Marker	RADIATION COUPLING Use six turn loop across generator output. Place close to cabinet back.	Oscillator trimmer C2-B for maximum
1400 Kc.	Third Calibration from Right		Antenna Trimmer C2-A for maximum

Check tracking at 1000 Kc, 600 Kc, and 535 Kc to be sure oscillator is set correctly.

ELECTRICAL SPECIFICATIONS

Power Supply ..... 105 to 125 volts, AC, 60-cycles; Chassis only 75 watts.

Frequency Ranges ..... Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.

Intermediate Freq. ..... AM-455 kc.; FM-10.7 mc.

Selectivity ..... AM-47 kc. broad at 1000 times signal, measured at 1000 kc. I.F. FM-230 kc. broad at 2 times down. I.F. FM-470 kc. broad at 10 times down.

AM Sensitivity ..... (For .5 watt output)—200 microvolts per meter average.

FM Sensitivity ..... (For .5 watt output)—30 microvolts average.

Power Output ..... 1.5 watts. 10% distortion. 3.0 watts maximum.

Loud Speaker ..... 5"x 7" PM. Voice coil impedance 3.2 ohms, 400 cycles.

Tube Complement .....

12AT7, FM-RF amp. mixer; 6BA7, AM converter, FM oscillator; 6BA7, IF amplifier; 6AU6, FM driver; 6AL5, FM detector; 6AV6, AM detector; 6V6 output; 5Y3, rectifier.

©John F. Rider

MODEL 8AF25

ALIGNMENT PROCEDURE

FM Band Section I. F. and R. F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube voltmeter, can have both the positive and negative sides connected to points above ground and still give true readings. (See note "C" below.)

A standard AM signal generator is required.

FM —I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .05 volt	Pin No. 1 of 6AU6	Pin No. 7 of 6AL5 and chassis	Bottom Core Primary of T9 Ratio Detector	Resonance should be about 3 volts
10.7 Mc. Use about .05 volt	Pin No. 1 of 6AU6	See note "A"	Top Core Secondary of T9 Ratio Detector	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 1800 microvolts	Pin No. 1 of 6BA6	Pin No. 7 of 6AL5 and chassis	Primary and Secondary of T7. FM Driver IF See chassis view	Resonance should be about 3 volts
10.7 Mc. Use about 400 microvolts	Top end of C2-C	Pin No. 7 of 6AL5 and chassis	Primary and Secondary of T5. FM Input IF See chassis view	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A"—Connect two resistors in series, 100K OHMS each, from Pin No. 7 of 6AL5 to chassis (Pin No. 5). These resitors must be matched within 5%. Connect vacuum tube voltmeter between the midpoint of the resistors and point zz.

NOTE "B"—If T9 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necesary.

NOTE "C"—To use a VTVM which does not have the "floating ground" feature, in step 2 above, connect "ground" side of VTVM to midpoint of resistors (Note "A") and "high" side to point zz.

GENERAL—Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM—R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of dial marker at the extreme left when gang is closed.

For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	POINTER	CONNECTION TO RADIO	ADJUST	V T V M CONNECTIONS
108 mc.	108 mc. Marker	FM antenna terminals	FM Osc. C3 for maximum	Pin No. 7 of 6AL5 to chassis.
98 mc.	Tune in Gen. Signal	See Note "B" below.	FM Mixer C2-C for maximum	

NOTE "A"—If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube voltmeter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE "B"—Connect 300 ohms in series with "hot" side of generator and connect to left hand screw of external FM Antenna Terminals. Connect cold side of generator to right hand screw.

MODELS 0526, 526A, 526B, 526C, 526E

AC-DC SUPERHETERODYNE RADIO RECEIVER

GENERAL

The Bendix Radio Models 0526 and 526 incorporate two similar chassis designated as O-1 and R-1. They are both AC-DC operated, 5 tube, superheterodyne receivers providing reception of the Standard Broadcast Band. A high impedance loop antenna is installed on the back of the chassis. An outside antenna may be connected to the terminal, marked EXTERNAL ANTENNA, on the bottom of Models 526A and 526B and on the rear of Models 526C and 526E. The tuning gang is isolated from the chassis and carries AVC. Care must be exercised so that it is not grounded at any time. The Models shown in Fig. 1 and Fig. 2 use both the O-1 and R-1 chassis, but only the O-1 chassis is employed in Model 526E (see Fig. 3).

MODELS 0526, 526A,
526B, 526C, 526E

PRELIMINARY ALIGNMENT PROCEDURE

Connect line cord plug to 117 volt AC power source and allow receiver and test equipment to warm up for at least five minutes. Set Volume control at maximum and connect output meter across voice coil. (If a DC VTVM is available it may be more convenient to connect from tuning gang stator to chassis ground, thus using AVC voltage to indicate circuit resonance. Volume can then be kept low, no modulated signal is needed, and a steadier indication on the meter is obtained.) Make all adjustments in order given in table and tune for maximum output. Keep input as low as possible at all times.

For the O-1 chassis, pre-set dial pointer with gang condenser fully counterclockwise by sliding pointer on dial cord until it is exactly 2 inches from left end of dial back plate. Refer to alignment chart and to diagram of Dial Reference Points, Fig. 4, for proper input signals and their corresponding reference points.

On the R-1 chassis dial settings and frequency check points are indicated on the dial back plate.

PRECAUTIONS

An isolating transformer should be used between the power supply and the receiver if any of the test equipment is AC operated. The use of isolating capacitors is not recommended as AC through the capacitor may introduce hum modulation, and if the capacitors should break down, the test instruments are likely to be damaged.

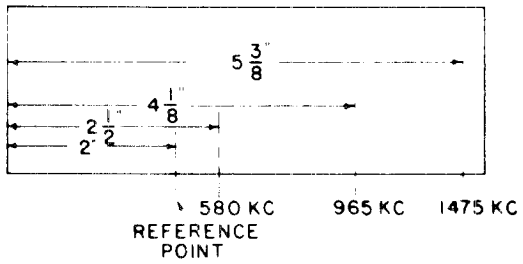

Fig. 4 Dial Reference Points O-1 Chassis

ALIGNMENT CHART

Generator Frequency	Generator Coupling	Circuit Aligned	Dial Setting	Adjust	Remarks
1) 455KC	Through .05 mfd to antenna	2nd IF	Maximum to right	C6a, C6b	Adjust for Maximum output
2) 1475KC	"	1st IF	5⅜" (See Fig. 4)	C3a, C3b	Adjust for Maximum output
3) 1475KC	"	RF	5⅜" (See Fig. 4)	C1b, C10	Adjust for Maximum output
4) REPEAT STEP 3 SEVERAL TIMES TO INSURE MAXIMUM OUTPUT					
5) 965KC	Through .05 mfd to antenna		4⅛" (See Fig. 4)		*Check Calibration
6) 580KC	"		2½" (See Fig. 4)		*Check Calibration

* If calibration is off more than 10KC bend plates of gang condenser. This is a very delicate operation and should be attempted only by experienced technicians.

CIRCUIT FOOTNOTES

The Schematic Diagram, Fig. 8, combines the two similar chassis O-1 and R-1. Where differences occur, changes are noted on the diagram by dotted lines, and a letter beside each circuit element involved indicates the corresponding footnote.

A. Capacitor C13a, b (40-40 mfd) is found in O-1 chassis. Capacitor C13a, b, c (40-40-12 mfd) is found in R-1 chassis.

B. R11 is 2200 ohms in O-1 chassis and 1500 ohms in R-1 chassis.

C. R14 (230 ohms) is used in R-1 chassis, not in O-1 chassis.

D. R10 (33 ohms) is not used in R-1 chassis.

E. R12 (33 ohms) is not used in R-1 chassis.

F. R9 (100 ohms) is not used in R-1 chassis.

G. R6 is 4.7 meg in O-1 chassis, but may be either 4.7 or 10 meg in R-1 chassis.

H. R15 (33 ohms) is not used in O-1 chassis.

I. C2 is .004 mfd in R-1 chassis, but may be .004 mfd or 470 mmf in O-1 chassis.

J. C4 (47 mmf) is 50 mmf in some receivers.

K. C9 may be either 300 mmf or 330 mmf in O-1 chassis. It is not used in R-1 chassis.

L. C11 is .01 mfd in O-1 chassis and .03 mfd in R-1 chassis.

M. C12 (.05 mfd) is used in O-1 chassis, not in R-1 chassis.

N. C15 (.05 mfd) is used in R-1 chassis, not in O-1 chassis.

O. In R-1 chassis only, T1 may be a "K" transformer in some units.

P. In some units of R-1 chassis only, C5 (.05 mfd) may be connected between the untuned winding of L2 and the lower end of R2.

MODELS 55P2, 55L2, 55L3 AND 55P3

GENERAL

Connect line cord plug to correct power source (see SPECIFICATIONS) and turn on receiver and any power operated test equipment. Allow a five minute warm up period before beginning alignment. Turn tuning gang fully closed (low end of band) and set dial pointer directly over point marked REFERENCE.

After warm up period, rotate tuning condenser fully open and turn volume control to maximum ON position. Place a low range output meter across voice coil and refer to ALIGNMENT CHART for detailed alignment procedure.

Connect signal generator to external antenna through isolating capacitor designated in ALIGNMENT CHART. Be sure to adjust slugs at both top and bottom of IF cans beginning with T2. Keep input signal as low as practicable at all times and make all adjustments for maximum output meter reading.

PRECAUTIONS

Various interchangeable IF transformer cans are used in these receivers. The chassis is punched to accommodate either the small, slug tuned type or the larger, capacitor tuned IF cans. Before aligning one of these radio receivers, determine the type of IF can used and align set accordingly.

An isolating transformer should be used between the AC power line and the receiver for protection of any test equipment that must be operated from the same power line.

SPECIFICATIONS

Power Requirements	
Voltage	105-120V AC or DC
Frequency	50-60 CPS
Power Consumption	30 Watts
IF Frequency	455 KC
Tuning Range	540-1620 KC
Max. Power Output	1.8 Watts
Loudspeaker	PM
Cone Diameter	4 Inches
Voice Coil Impedance	3.2 Ohms @ 400 CPS

MODEL 55X4

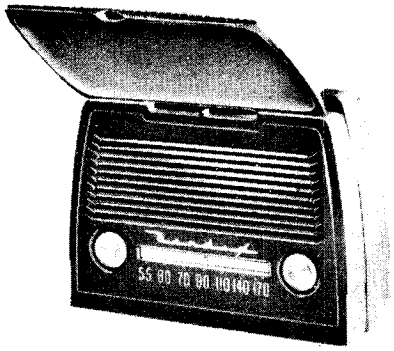

Fig. 1 - Model 55X4

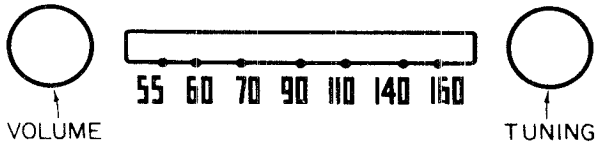

NOTE: OFF-ON SWITCH IS CONTROLLED BY POSITION OF FRONT DOOR.

BATTERY POWER MAY BE USED ONLY WHEN LINE CORD PLUG IS INSERTED INTO CHASSIS RECEPTACLE.

Fig. 2 - Control Layout

GENERAL

Connect line cord plug to correct power source (see Specifications) and allow receiver and any power operated test equipment to warm up for at least five minutes before attempting alignment. This portable chassis has a door switch and when set is out of the cabinet, the receiver can be turned on by merely plugging in the line cord. Depressing the door switch turns the receiver off.

Turn tuning gang fully closed (low end of band) and set dial pointer directly over point marked Reference (Fig. 4).

After warm up period, rotate tuning condenser fully open and adjust volume control to maximum. Place a low range output meter across voice coil and then follow instructions presented in the Alignment Chart.

SPECIFICATIONS

Power Requirements
Voltage . . . . . 105-120 AC or DC
. . . . 6 and 67V Batteries
Frequency. . . . . 60 Cps

MODEL 65P4

ALIGNMENT PROCEDURE

Connect line cord plug to 117 volt, 60 cycles AC power source. Set volume control at maximum clockwise position and tone control (S2) in counterclockwise position. Connect output meter across voice coil. Adjust dial pointer by turning tuning control fully counterclockwise and sliding dial pointer on dial cord to Reference Mark on dial back plate, (See Fig. 6). Make all adjustments in order given in ALIGNMENT CHART on opposite page and for maximum output. Keep input as low as possible at all times.

PRECAUTIONS

An isolating transformer should be used between the power supply and the receiver if any of the test equipment is AC operated. The use of isolating capacitors is not recommended as AC though the capacitor may introduce hum modulation, and if the capacitors should break down the test instruments will likely be damaged.

Fig. 1 - Models 75B5, 75W5, 75M5, 75P6, 75M8

GENERAL

The Bendix Radio Models 75P6, 75B5, 75W5, 75M5, and 75M8 employ six tubes and a selenium rectifier to provide reception of the FM band and AM standard broadcast band. The FM section of this receiver contains a tuned RF stage. This RF stage has its plate voltage removed when the range switch is in any but the FM position. The console models have B+ removed from the plates of the RF amplifier and mixer-oscillator tubes when the band switch is in the PH position. These models also have built-in AM and FM antennas; but while the Model 75P6 (table model) makes use of the AM built-in loop antenna, it uses a line coupler type of FM antenna. When using the line coupler antenna the link indicated in Fig. 6 should be connected as shown. However, should an external antenna be desired, disconnect the link by pivoting it on terminal (#1), and connect the external antenna to terminals #2 and #3 indicated in Fig. 6.

The Model 75M8 is similar to Models 75B5, 75W5, and 75M5, differing mainly in the speakers and associated parts. Model 75M8 has two six inch speakers connected in parallel. To match the impedance of both speakers, the output transformer has an impedance of 1.6 ohms. Each of the Models 75B5, 75W5, and 75M5 uses one eight inch speaker and the output transformer has, therefore, an impedance of 3.2 ohms.

The console models operate strictly on AC since a phono motor is used. The table model does not contain a record changer, and operates on either DC or 60 cycles AC power.

The multi-purpose 19T8 tube combines the functions of an AM demodulator, FM detector, and first audio amplifier, in one envelope. The 12AT7, a double triode, is used as a mixer-oscillator tube.

Model 75W5 66 lbs.
Model 75M5 66 lbs.
Model 75M8 83 lbs.

ALIGNMENT PROCEDURE

The AM circuits should be aligned before the FM section because of possible interaction between the IF coils. Before attempting to align set allow receiver and test equipment to warm up for at least five minutes. Whenever possible, have a speaker connected to the output and use a 30% amplitude modulated signal in order to identify weak signals in a poorly tuned set. The antenna trimmer for AM in Models 75B5, 75W5, 75M5, and 75M8 must be adjusted when the chassis is replaced in the cabinet, since the antenna loop is installed on the back cover and cannot be removed with the chassis. It may be necessary to adjust the FM antenna slightly when the chassis is replaced in the cabinet.

TEST EQUIPMENT REQUIRED

Signal Generator
AM 455 KC to 106 MC
FM 10.7 MC & 88-108 MC
Vacuum Tube Voltmeter
(ground or minus must be isolated from power line)
Capacitors, .01 mfd and 100 mmf
Alignment Screwdrivers
Standard Output Meter

AM ALIGNMENT

PRELIMINARY PROCEDURE: With gang condenser closed, set dial pointer to coincide with reference mark etched into dial back plate. See Fig. 3. Place band switch in AM position and use a 30% modulated signal throughout. Connect an output meter across voice coil. Adjust Antenna Trimmer C3a after chassis is installed in the cabinet. Keep input as low as possible while obtaining a stable output meter reading.

GENERATOR FREQUENCY	GENERATOR COUPLING	DUMMY ANTENNA	SPECIAL CONDITIONS	DIAL SETTING	ADJUSTMENTS	REMARKS
1.) 455 KC AM	High Side--Term. #5 gang cond. Low side--common ground	.01 mfd capacitor	Short AM Osc. Term. #1 to common ground	Gang condenser fully open	Top Slug of T1, T2, T4 and bottom slug of T4	Adjust for maximum output. Repeat several times to insure maximum output
2.) 1475 KC AM	High side--Term. #3 gang cond. Low side--common ground	100 mmf capacitor	Remove short from Osc. Term #1	1475 KC Rer. mark	C79	Rock Tuning control while adjusting for maximum output
3.) 965 KC AM	"	"		965 KC Ref. mark		* Check Calibration
4.) 580 KC	"	"		580 KC Ref. mark		* Check Calibration

* If calibration does not check within tolerances denoted by etched lines on dial backplate, oscillator gang rotor plates must be bent to obtain proper calibration. This operation is very delicate and should be attempted only by properly trained personnel.

FM ALIGNMENT -- CW METER METHOD

Preliminary Alignment Procedure: With gang condenser fully closed, adjust dial pointer to coincide with the reference mark etched into dial back plate. See Fig. 3. Place band switch in FM position. Use 30% amplitude modulated signals when possible.

GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR COUPLING	SPECIAL CONDITIONS	DIAL SETTING	VTVM CONNECTIONS	ADJUSTMENTS	REMARKS
1.)10.7 MC AM or CW	.01 mfd capacitor	High side-term. #4 Gang Condenser. Low side-common ground	Short FM Osc. Term. #2 of Gang Condenser to common ground.	Gang Condenser fully open	+Lead to B- -Lead to Pin #2 of tube 19T8	Bottom Slug of T1,T2, Top slug of T3	Adjust for maximum AVC reading on VTVM. Repeat adjustment several times to insure maximum reading
2.)Remove Signal Generator		Remove Signal Generator	Short FM Osc. term. #2 of gang condenser to common ground. Two 100K matched resistors in series connected between Pin #2 of tube 19T8 & B-	"	Center Tap of 100K resistors and term. #6 of switch S1C	Adjust VTVM for Zero	While connected to chassis, the VTVM is adjusted to zero by its zero centering control
3.)10.7 MC AM or CW	.01 mfd capacitor	High side-term. #3 of Gang condenser, Low side-Common Ground	"	"	"	Bottom slug of T3	Adjust bottom slug to produce zero reading on VTVM
4.) Repeat Steps 1, 2, and 3 until Step 1 produces no change in Step 3 adjustment and top of T3 produces no deflection in Step 3.							
5.)106 MC	FM Dummy Antenna (See Fig. 2)	FM Dummy Antenna (See Fig. 2)	Remove short from Term. #2 of gang condenser. Remove 100K Resistors	106 MC Ref. mark	+Lead to B- -Lead to Pin #2 of tube 19T8	Osc. trimmer C9, then RF, C3c & Ant., C36	Rock tuning control when adjusting C9 for maximum AVC reading, then adjust C3c and C3b respectively for maximum †
6.)97 MC AM or CW	"	"		97 MC Ref. mark	"		* Check Calibration
7.)90 MC AM or CW	"	"		90 MC Ref. mark	"		* Check Calibration

† Oscillator operates on high frequency side of incoming signal but it is possible to adjust to the low side. Set Signal Generator to 84.6 MC and if signal is heard readjust oscillator trimmer at signal generator frequency of 106 MC and check again at 84.6 MC. Signal should not be heard.

* If calibration is not within reasonable tolerance at these points, the inductance of the FM oscillator coil must be adjusted. If dial pointer reading is on low frequency side, inductance of oscillator coil is too low and turns of coil must be compressed slightly, If pointer reading is on high frequency side, the coil inductance is too high and coil turns must be spread slightly. Repeat steps 5, 6, and 7 until correct calibration is obtained.

To adjust RF coil, tune receiver to 90 MC and observe AVC reading. Insert into RF coil, the iron core of tuning wand (rod of insulating material one end of which contains an iron core slug and the other end contains a non-ferrous metallic slug). If reading increases, the inductance of coil is too low and, turns must be spread *slightly*. If reading decreases, insert opposite end (non-ferrous) of tuning wand into RF coil. Inductance of coil is too low if reading increases and, turns must be compressed *slightly*. Correct adjustment is obtained when insertion of either end of tuning wand causes the reading to decrease.

The antenna coil inductance is adjusted in the same manner as the RF coil.

MODELS 75B5, 75M5, 75M8, 75P6, 75W5

VISUAL ALIGNMENT OF RATIO DETECTOR

The ratio detector in the FM section of this radio receiver can be aligned by the so-called Visual Alignment method. This method can be used in conjunction with the CW method by following the procedure outlined below:

1. Perform Step 1 indicated in CW Meter Method Chart.
2. Set Signal Generator to 10.7 MC, FM, with sweep width at maximum possible (should be a minimum of 200 KC). Connect output of generator to terminal #4 of gang condenser and B-.
3. Connect vertical input of cathode ray oscilloscope to terminal #6 of switch S1C and B-, and place a 60 cycle sine wave signal to horizontal input if oscilloscope does not have an internal 60 cycle sweep.

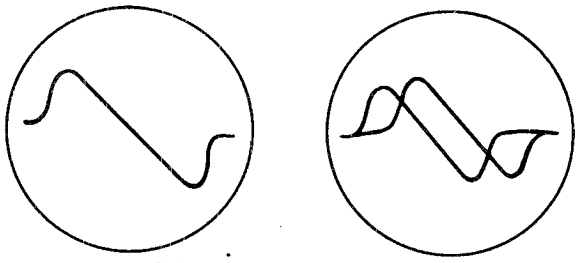

Fig. 4 - S Curves

4. Adjust signal generator frequency until 'S' curve (Fig. 4) is centered on the horizontal sweep. Curve may be reversed because of internal circuit of oscilloscope.
5. Adjust primary of T3 (top slug) and secondary (bottom slug) for maximum desired 'S' curve. A VTVM can be very useful at this point if connected to pin #2 of tube 19T8 and B-. The oscilloscope will then indicate the most linear curve and the VTVM will indicate the maximum AVC voltage.
6. Adjust bottom of slugs of T1 and T2 and then repeat step 5 to insure correct alignment.
7. Continue at this point with the alignment procedure starting with step 5 as outlined in the FM-CW Meter Method.

FM ANTENNA

The FM antenna used in Models 75B5, 75W5, 75M5, and 75M8 will not be found in the Replacement Parts List since the service man, by following the specifications in the drawing below, can very easily and inexpensively make the antenna himself.

Rectifier 5Y3 –– Total 7 Tubes
Loudspeaker
10" PM
Record Changer
Automatic for Twelve 10-inch or Ten 12-inch Standard Lateral Cut or Long Play Microgroove Records

GENERAL

Bendix Radio Model 79M7 employs seven tubes including a rectifier to provide reception of the FM and AM standard broadcast bands. Two individual chassis are used in this receiver. The power supply is found in the smaller chassis. The FM section of this receiver contains a tuned RF stage of amplification which has the plate voltage removed from its tube when the band switch is in any but the FM position. Built-in AM and FM antennas are attached to the cabinet. An external AM antenna may be connected to the terminal board provided on the rear of the cabinet. When an external FM antenna is used, the built-in FM antenna must be disconnected from the binding screws located on the back of the cabinet and labelled "FM Dipole", and the external antenna connected to these two terminals. The power supply required for this model is 105–120 volts 60 cycle AC since a phono motor is included. The radio chassis itself is operative on AC or DC, but the phono motor would be damaged beyond repair if operated on DC. The multi-purpose 6T8 combines the functions of AM demodulator, FM detector, and first audio amplifier in one envelope. The 12AT7, a double triode, is used as a mixer-oscillator tube. The ten inch permanent magnet type speaker is driven by a 6V6GT audio output tube.

©John F. Rider

PRELIMINARY ALIGNMENT PROCEDURE

The AM circuits should be aligned before the FM section because of possible interaction between the IF coils. Before attempting to align set allow receiver and test equipment to warm up for at least five minutes. Whenever possible, have a speaker connected to the output and use a 30% amplitude modulated signal in order to identify weak signals in a poorly tuned set. The antenna trimmer for AM which is attached to the loop antenna must be adjusted when the chassis is replaced in the cabinet, since the antenna loop is installed in the cabinet and cannot be removed with the chassis. It may be necessary to adjust the FM antenna trimmer slightly when the chassis is replaced in the cabinet.

TEST EQUIPMENT REQUIRED

Signal Generator
AM 455 KC to 106 MC
FM 10.7 MC & 88–108 MC
Vacuum Tube Voltmeter
(ground or minus must be isolated from power line)
Capacitors, .01 mfd and 100 mmf
Alignment Screwdrivers
Standard Output Meter

AM ALIGNMENT

PRELIMINARY PROCEDURE: With gang condenser closed, set dial pointer to coincide with reference mark etched into dial back plate. See Fig. 5. Place band switch in AM position and use a 30% modulated signal throughout. Connect an output meter across voice coil. Adjust Antenna Trimmer C67 after chassis is installed in the cabinet. Keep input as low as possible while obtaining a stable output meter reading.

GENERATOR FREQUENCY	GENERATOR COUPLING	DUMMY ANTENNA	SPECIAL CONDITIONS	DIAL SETTING	ADJUSTMENTS	REMARKS
1.) 455 KC AM	High Side—Term. #5 gang cond. Low side—common ground	.01 mfd capacitor	Short AM Osc. Term. #1 to common ground	Gang condenser fully open	Top slug of T1, T2, T4 and bottom slug of T4	Adjust for maximum output. Repeat several times to insure maximum output
2.) 1475 KC AM	High side—Term. #3 gang cond. Low side—common ground	100 mmf capacitor	Remove short from Osc. Term. #1	1475 KC Ref. mark	C17	Rock tuning control while adjusting for maximum output
3.) 965 KC AM	"	"		965 KC Ref. mark		* Check Calibration
4.) 580 KC	"	"		580 KC Ref. mark		* Check Calibration

* If calibration does not check within tolerances denoted by etched lines on dial backplate, oscillator gang rotor plates must be bent to obtain proper calibration. This operation is very delicate and should be attempted only by properly trained personnel.

FM ANTENNA

The FM antenna used with Model 79M7 will not be found in the Replacement Parts List since the service man, by following the specifications in the drawing, Fig. 3, can very easily and inexpensively make the antenna himself.

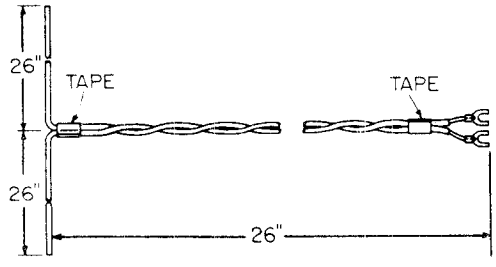

Fig. 3 – FM Antenna

MODEL 79M7

FM ALIGNMENT

CW METER METHOD

PRELIMINARY ALIGNMENT PROCEDURE: With gang condenser fully closed, adjust dial pointer to coincide with the reference mark etched into dial back plate. See Fig. 5. Place band switch in FM position. Use 30% amplitude modulated signals when possible.

GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR COUPLING	SPECIAL CONDITIONS	DIAL SETTING	VTVM CONNECTIONS	ADJUSTMENTS	REMARKS
1.) 10.7 MC AM or CW	.01 mfd capacitor	High side—term. #4 Gang Condenser. Low side—chassis ground	Short FM Osc. Term. #2 of Gang Condenser to chassis ground	Gang Condenser fully open	+Lead to chassis ground —Lead to Pin 2 of tube 6T8	Bottom slug of T1, T2, Top slug of T3	Adjust for maximum AVC reading on VTVM. Repeat adjustment several times to insure maximum reading
2.) Remove Signal Generator		Remove Signal Generator	Short FM Osc. term. #2 of gang condenser to common ground. Two 100K matched resistors in series connected between Pin #2 of tube 6T8 & chassis ground	"	Center Tap of 100K resistors and term. #6 of switch S1C	Adjust VTVM for Zero	While connected to chassis, the VTVM is adjusted by its zero centering control
3.) 10.7 MC AM or CW	.01 mfd capacitor	High side—term. #4 of Gang condenser. Low Side—chassis Ground	"	"	"	Bottom slug of T3	Adjust bottom slug to produce zero reading on VTVM
4.) Repeat Steps 1, 2, and 3 until adjustment in Step 1 does not require a readjustment to produce a zero reading on the VTVM in Step 3.							
5.) 106 MC	FM Dummy Antenna (See Fig. 4)	FM Dummy Antenna Terminals (See Fig. 4)	Remove short from Term. #2 of gang condenser. Remove 100K Resistors	106 MC Ref. mark	+Lead to chassis ground —Lead to Pin 2 of tube 6T8	Osc. trimmer C3, then RF, C2c & Ant., C2a	Rock tuning control when adjusting C3 for maximun AC reading, then adjust C2c and C2a respectively for max.†
6.) 97 MC AM or CW	"	"		97 MC Ref. mark	"		* Check Calibration
7.) 90 MC AM or CW	"	"		90 MC Ref. mark	"		* Check Calibration

† Oscillator operates on high frequency side of incoming signal but it is possible to adjust to the low side. Set Signal Generator to 84.6 MC (with receiver set to 106 MC); if signal is heard, readjust oscillator trimmer at signal generator frequency of 106 MC and check again at 84.6 MC. Signal should not be heard.

* If calibration is not within reference mark at these points, the inductance of the FM oscillator coil must be adjusted. If dial pointer reading is on low frequency side, inductance of oscillator coil is too low and turns of coil must be compressed slightly. If pointer reading is on high frequency side, the coil inductance is too high and coil turns must be spread slightly. Repeat steps 5, 6, and 7 until correct calibration is obtained.

To adjust RF coil, tune receiver to 90 MC and observe AVC reading. Insert into RF coil, the iron core of tuning wand (rod of insulating material one end of which contains an iron core slug and the other end contains a non-ferrous metalic. slug). If reading increases, the inductance of coil is too low and turns must be spread *slightly*. If reading decreases, insert opposite end (non-ferrous) of tuning wand into RF coil. Inductance of coil is too low if reading increases and turns must be compressed *slightly*. Correct adjustment is obtained when insertion of either end of tuning wand causes the reading to decrease.

The antenna coil inductance is adjusted in the same manner as the RF coil.

VISUAL ALIGNMENT

The ratio detector in the FM section of this radio receiver can be aligned by the so-called Visual Alignment method. This method can be used in conjunction with the CW method by following the procedure outlined below:

1. Perform Step 1 indicated in CW Meter Method Chart.

2. Set Signal Generator to 10.7 MC, FM, with sweep width at maximum possible (should be a minimum of 200 KC). Connect output of generator to terminal #4 of gang condenser and B–.

3. Connect vertical input of cathode ray oscilloscope to terminal #6 of switch S1C and B–, and place a 60 cycle sine wave signal to horizontal input if oscilloscope does not have an internal 60 cycle sweep.

4. Adjust signal generator frequency until "S" curve (Fig. 6) is centered on the horizontal sweep. Curve may be reversed because of internal circuit of oscilloscope.

5. Adjust primary of T3 (top slug) and secondary (bottom slug) for maximum desired "S" curve. A VTVM can be very useful at this point if connected to pin #2 of tube 6T8 and B–. The oscilloscope will then indicate the most linear curve and the VTVM will indicate the maximum AVC voltage.

6. Adjust bottom of slugs of T1 and T2 and then repeat step 5 to insure correct alignment.

7. Continue at this point with the alignment procedure starting with step 5 as outlined in the FM-CW Meter Method.

GENERAL

Bendix Radio Models 95M3, 95B3, and 95M9 employ nine tubes including a rectifier to provide reception of the FM and AM standard broadcast bands. Two individual chassis are used in each of these radio receivers. The power supply and the push-pull audio output circuit are found on the smaller chassis. The FM section of this receiver contains a tuned RF stage of amplification which has the plate voltage removed from its tube when the band switch is in any but the FM position. Built-in AM and FM antennas are attached to the cabinet. A power supply of 105-120 volts 60 cycle AC is required for the operation of these radio receivers. The multi-purpose 6T8 tube combines the functions of AM demodulator, FM detector, and first audio amplifier in one envelope. The 12AT7, a double triode, is used as a mixer-oscillator tube; and push-pull audio output is provided by two 6K6GT tubes. A plug on the cabinet back cover provides for the use of Long Playing record players. The switch associated with this plug on the back cover is used to connect to the radio chassis either the standard record player installed in the cabinet or a separate Long Playing record player.

MODELS 95B3, 95B3 Rev., 95B4, 95M3, 95M3 Rev., 95M4, 95M9, 95M9 Rev.

PRECAUTION NOTES

Hum may be introduced if the leads connected to switch, S2, on the volume control are dressed toward the base of 12AT7 tube. The leads should be pushed directly against the side of the chassis to a point approximately half an inch from the bottom edge of the chassis and adjacent to the volume control and then led along the sides of the chassis to plug J2.

The capacitor, C28, should be dressed under R18 with the capacitor leads as short as possible. In addition, the filament lead of V2, 12AT7, should be as short as possible and connected directly between pin 9 of V2 and the terminal board.

Oscillation may occur if the AM oscillator coil (L2) is not positioned correctly. The recommended spacing is:

9/16" between osc. coil and front of sub-chassis
3/4" between osc. coil and bottom of sub-chassis
1/2" between osc. coil and end of main chassis.

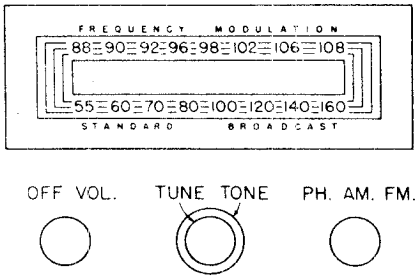

Fig. 2 - Control Diagram

ALIGNMENT PROCEDURE

The AM section should be aligned before the FM section because of possible interaction between the coils in the IF cans. Before attempting to align set allow receiver and test equipment to warm up for at least five minutes. Whenever possible, have a speaker connected to the output and use a 30% amplitude modulated signal in order to identify weak signals in a poorly tuned set. It may be necessary to adjust the FM antenna trimmer slightly when the chassis is replaced in the cabinet.

TEST EQUIPMENT REQUIRED

Signal Generator
AM 455 KC to 106 MC
FM 10.7 MC & 88-108 MC
Vacuum Tube Voltmeter
(ground or minus must be isolated from power line)
Capacitors, .01 mfd and 100 mmf
Alignment Screwdrivers made from a high dielectric, non-metallic material
Standard Output Meter

AM ALIGNMENT

PRELIMINARY PROCEDURE: With gang condenser closed, set dial pointer to coincide with reference point etched into dial back plate. See Fig. 4. Place band switch in AM position and use a 30% modulated signal throughout. Connect an output meter across voice coil. Adjust Antenna Trimmer C2b again after chassis is installed in the cabinet.

GENERATOR FREQUENCY	GENERATOR COUPLING	DUMMY ANTENNA	SPECIAL CONDITIONS	DIAL SETTING	ADJUSTMENTS	REMARKS
1. 455 KC AM	High Side--Term. #5 gang cond. Low side--chassis ground	.01 mfd capacitor	Short AM Osc. Term. #1 to chassis ground	Gang condenser fully open	Top Slug of T1, T2, T4 and bottom slug of T4	Adjust for maximum output. Repeat several times to insure maximum output
2. 1475 KC AM	High side--Term. #3 gang cond. Low side--chassis ground	100 mmf capacitor	Remove short from Osc. Term #1	1475 KC Ref. mark	C17	Rock Tuning Control while adjusting for maximum output
3. 965 KC AM	"	"		965 KC Ref. mark		* Check calibration
4. 580 KC AM	"	"		580 KC Ref. mark		* Check calibration

* If calibration does not check within tolerances denoted by etched lines on dial backplate, oscillator gang rotor plates must be bent to obtain proper calibration. This operation is very delicate and should be attempted only by properly trained personnel.

FM ALIGNMENT
CW METER METHOD

Preliminary Alignment Procedure: With gang condenser fully closed, adjust dial pointer to coincide with the reference mark etched into dial back plate. See Fig. 4. Place band switch in FM position. Use 30% amplitude modulated signals when possible.

GENERATOR FREQUENCY	DUMMY ANTENNA	GENERATOR COUPLING	SPECIAL CONDITIONS	DIAL SETTING	VTVM CONNECTIONS	ADJUSTMENTS	REMARKS
1. 10.7 MC AM or CW	.01 Mfd Capacitor	High side--Term. #4 Gang Cond. Low side--chassis ground	Short FM Osc. Term. #2 of Gang Cond. to chassis ground	Gang condenser fully open	+Lead to chassis ground -Lead to Pin 2 of tube 6T8	Bottom slug of T1, T2, Top slug of T3	Adjust for maximum AVC reading on VTVM. Repeat adjustment several times to insure maximum reading
2. Remove Signal Generator		Remove Signal Generator	Short FM Osc. Term. #2 of gang cond. to common ground Two 100K matched resistors in series connected between Pin 2 of tube 6T8 & chassis ground	"	Center tap of 100K resistor and Term. #6 of switch S1C	Adjust VTVM for Zero	While connected to chassis, the VTVM is adjusted by its zero centering control
3. 10.7 MC AM or CW	.01 Mfd capacitor	High side--term #3 of Gang cond. Low side--chassis ground	"	"	"	Bottom slug of T3	Adjust bottom slug to produce zero reading on VTVM
4. Repeat Steps 1, 2, and 3 until adjustment in Step 1 does not require a readjustment to produce a zero reading on the VTVM in Step 3.							
5. 106 MC	FM Dummy Antenna (See Fig. 3)	FM Dummy Antenna Terminals (See Fig. 3)	Remove short from Term. #2 of gang cond. Remove 100K Resistors	106 MC Ref. mark	+Lead to chassis ground -Lead to Pin 2 of tube 6T8	Osc. trimmer C3 then RF, C2c & Ant., C2a	Rock tuning control when adjusting C3 for maximum AC reading, then adjust C2c and C2a respectively for maximum †
6. 97 MC AM or CW	"	"		97 MC Ref. mark	"		* Check calibration
7. 90 MC AM or CW	"	"		90 MC Ref. mark	"		* Check calibration

† Oscillator operates on high frequency side of incoming signal but it is possible to adjust to the low side. Set Signal Generator to 84.6 MC (with receiver set to 106 MC); if signal is heard, readjust oscillator trimmer at signal generator frequency of 106 MC and check again at 84.6 MC. Signal should not be heard.

* If calibration is not within reference mark at these points, the inductance of the FM oscillator coil must be adjusted. If dial pointer reading is on low frequency side, inductance of oscillator coil is too low and turns of coil must be compressed slightly. If pointer reading is on high frequency side, the coil inductance is too high and coil turns must be spread slightly. Repeat steps 5, 6, and 7 until correct calibration is obtained.

To adjust RF coil, tune receiver to 90 MC and observe AVC reading. Insert into RF coil, the iron core of tuning wand (rod of insulating material one end of which contains an iron core slug and the other end contains a non-ferrous metallic slug). If reading increases, the inductance of coil is too low and turns must be spread *slightly*. If reading decreases, insert opposite end (non-ferrous) of tuning wand into RF coil. Inductance of coil is too low if reading increases and turns must be compressed *slightly*. Correct adjustment is obtained when insertion of either end of tuning causes the reading to decrease.

The antenna coil inductance is adjusted in the same manner as the RF coil.

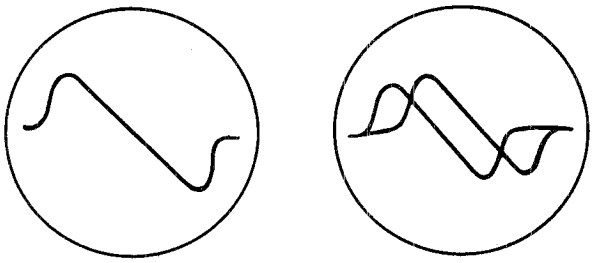
VISUAL ALIGNMENT OF RATIO DETECTOR

The ratio detector in the FM section of this radio receiver can be aligned very accurately by Visual Alignment. This method can be used in conjunction with the CW method by following the procedure outlined below.

1. Perform Step 1 indicated in CW Meter Method Chart.

2. Set Signal Generator to 10.7 MC, FM, with sweep width at maximum possible (should be a minimum of 200 KC). Connect output of generator to terminal #4 of gang condenser and ground.

3. Connect vertical input of cathode ray oscilloscope to terminal #6 of switch S1C and 'ground'; place a 60 cycle sine wave signal to horizontal input if oscilloscope does not have an internal 60 cycle sweep.



a *b*

Fig. 5 - S Curves

4. Adjust signal generator frequency until 'S' curve (Fig. 5) is centered on the horizontal sweep. Curve may be reversed because of internal circuit of oscilloscope. Fig. 5b indicates when 'Phase Control' of oscilloscope is incorrectly adjusted.

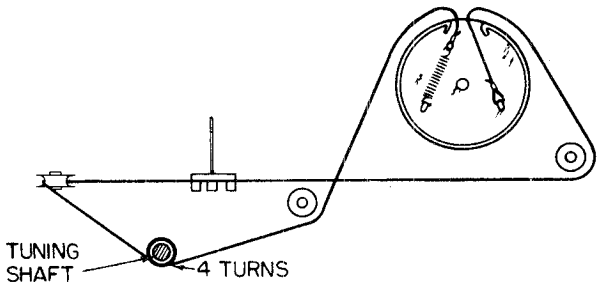


Fig. 6 - Dial Stringing Diagram

5. Adjust primary of T3 (top slug) and secondary (bottom slug) for maximum desired 'S' curve. A VTVM can be very useful at this point if connected to pin 2 of tube 6T8 and ground. The oscilloscope will then indicate the most linear curve and the VTVM will indicate the maximum AVC voltage.

6. Adjust bottom slugs of T1 and T2 and then repeat step 5 to insure correct alignment.

7. Continue at this point, with the alignment procedure starting with step 5 as outlined in the FM CW Meter Method.

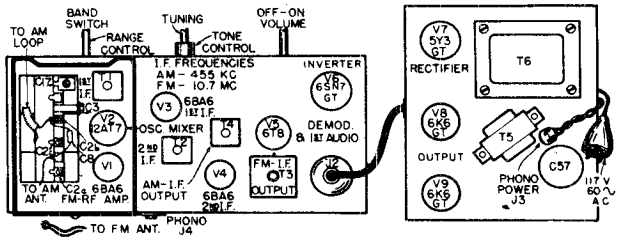

Fig. 7 - Trimmer Location

FM ANTENNA

The FM antenna used in Models 95M3, 95B3, and 95M9 will not be found in the Replacement Parts List since the serviceman, by following the specifications in the drawing below, can very easily and inexpensively make the antenna himself.

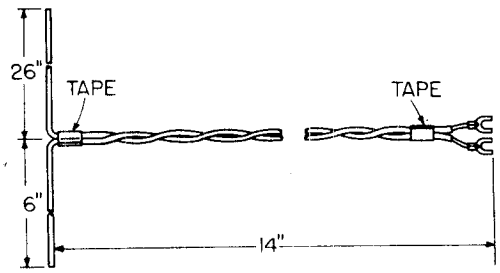

Fig. 8 - FM Antenna

BROWNING UNIVERSAL FM-AM TUNERS — MODEL RJ-20 AND MODEL RJ-22

These tuners are designed to please the most discriminating listener. Truly high fidelity reception of FM and AM broadcasting has been engineered into these tuners which are specifically intended for custom receiving installations. The AM section features variable I.F. bandwidth with a broad high fidelity position and a narrow, interference reducing position. The FM section uses Major Armstrong's circuit and features dual limiters for best noise elimination. Bass and treble controls provide 20 db of boost at either end of the audio band and the associated audio amplifiers assure output commensurate with phonograph pickups. The power supply is self-contained and the chassis is styled for ease of mounting in bookshelves, cupboards, drawers and other confined locations.

INSTALLATION:

In mounting the unit, due consideration must be given to ventilation. Approximately 100 watts of heat must be dissipated. Position of mounting is not important.

If the speaker is to be located in or very near the cabinet in which the tuner is located, it may be necessary to shock mount the tuner on rubber or felt pads to entirely eliminate mechanical feedback.

The output of the tuner may be fed directly into the input of any high quality amplifier and speaker system. The gain of the amplifier should be such that 0.5 volt RMS will provide the desired output.

Antenna connections must be made as shown in the drawing "RJ-20 Antenna Connections". As may be seen, all ordinary possibilities have been foreseen and any good commercial FM antenna may be used. For those who wish to make their own antenna, the drawing "RJ-20 antenna constructed of 300 ohm twin lead" is supplied. Careful adherence to this drawing will provide a very satisfactory antenna.

Shielded leads from the tuner to the amplifier and also from the phonograph pickup to the connectors at the rear of the chassis are essential. The two male connectors will be found plugged into the female chassis connectors in the RJ-20 and several feet of shielded wire is packed with each tuner. It is advisable to make these leads as short as possible in order not to impair the high frequency response. Since individual installations vary, this wire is supplied uncut.

When making up the cables, the center conductor should be stripped and tinned, inserted in the center sleeve of the connector and heated until the solder flows making a good joint. Bring the braid up on the outside shell of the plug and solder all the way around.

There are some cases where the shield braid on the lead between the audio output of the RJ-20 and the amplifier employed may not be sufficient ground bond between the two. In cases where there is any hum (not present in the amplifier itself), try bonding the RJ-20 chassis to the audio amplifier with heavy copper braid or number 16 or larger wire.

A panel layout of the RJ-20 appears on the next page to facilitate cutting the panel to fit the unit. The shaft lengths are such that panel thickness up to 1/4" may be used.

OPERATION:

After proper installation, the tuner may be put into operation by turning the ON-OFF switch clockwise; the dial should be immediately illuminated. Within a minute, the tuning eye should emit a bright green glow. The tuner is ready to operate on AM. Allow two minutes warmup for FM.

CONTROLS:

1. ON-OFF switch - Power switch independent of controls so they may be left in any desired position.
2. VOLUME - Controls audio output from FM, AM, or PHONO source.
3. AM-FM-PHONO - Bandswitch which selects type of reception desired.
4. NARROW-BROAD - Controls bandwidth of the AM I.F. amplifier. BROAD position is for high fidelity reception of strong, clear stations. NARROW position for best reception of weak stations or in crowded portions of the band. When tuning AM stations always tune in NARROW position switching to BROAD after tuning is complete.
5. TUNING - Selects stations on either FM or AM bands. Tune slowly and exactly using the tuning indicator as shown in drawing "RJ-20 Tuning Eye".
   Note: When tuning AM stations have NARROW-BROAD switch in NARROW position. After correct tuning is achieved, turn switch to BROAD if desired.
6. TREBLE - Provides 20 db of treble boost in full clockwise position.
7. BASS - Provides 20 db of bass boost in full clockwise position.

For flat response, both BASS and TREBLE should be fully counterclockwise.

For those who wish to incorporate phonograph connection to the tuner, a phono input connector is provided at the rear of the chassis. By turning the selector switch to PHONO, the phonograph input is connected to the amplifier through the tone and volume controls of the tuner. Bass and treble content as well as volume can be controlled directly with the tuner knobs.

It should be noted that while tuning between stations, both on FM and AM, the rushing noise is normal for the tuner. The extremely high sensitivity is responsible for picking up random atmospherics, but this will be eliminated when a station is tuned in provided the signal exceeds the noise voltage at the antenna.

ADJUSTMENT:

No adjustment should be made on the tuner aside from the panel controls. Adjustments and alignment on the FM portion should only be made by experienced personnel with the proper visual alignment equipment. Ordinary meters or aural methods are in general unsatisfactory for alignment. Replacement of tubes can usually be made without realignment.

INSTRUCTIONS FOR ALIGNMENT OF BROWNING MODELS RJ-20 AND RJ-22 FM-AM TUNER

Visual alignment of both FM and AM sections is to be preferred, but in case apparatus is not available, the following point-to-point method may be used. Visual alignment data are given in "DATA ON BROWNING MODEL RV-10 FM TUNER", which can be applied to the RJ-20 and the RJ-12A

EQUIPMENT EMPLOYED: FM SECTION

a. Signal generator covering 8,200 to 8,300 KC. with a sufficiently large dial so that 25 KC. can be accurately read.
b. Signal Generator from 88 to 108 MC.
c. A DC vacuum tube voltmeter which has an input resistance of more than three megohms.

IF-FM ALIGNMENT - Band Switch to FM Position.

1. Connect output of signal generator to ground and to pin #8 of the 7F8 mixer oscillator tube. (This point is most conveniently reached by connection to the stator plates of the mid-section of the three gang variable FM condenser - see instructions on RJ-20 for location of parts.) Set signal generator at 8,250 KC.
2. Connect vacuum tube voltmeter between ground and the lower end of the 1. meg. resistor, R53.
3. Tune primary and secondary of first, second and third FM IF transformers for substantially maximum limiter voltage as indicated by VTVM. Increase or decrease the output of the signal generator as required so that VTVM maximum reading is about 5 volts.
4. Set signal generator at 8,200 KC. The limiter voltage should be about the same as above (at 8,250 KC.)
5. Set signal generator at 8,300 KC. The limiter voltage should be about the same as at 8,250 KC.
6. If the FM IF response is not symmetrical, make adjustments on the FM IF transformers until a curve is obtained similar to that shown in Fig. 4 in "DATA ON BROWNING MODEL RV-10 FM TUNER".

FM DISCRIMINATOR ALIGNMENT

7. Connect DC VTVM between ground and the terminal of the 1 meg. resistor (R50) which is connected to the condenser C45. Set VTVM on 5 volt scale.
8. Connect signal generator as in No. 1. Set signal generator to 8,250 KC. and the output for about 5 volts on the limiter.
9. Adjust secondary of discriminator to zero voltage on VTVM. Use insulated screwdriver. Changing the tuning of the discriminator secondary should give positive and negative voltages either side of zero. Adjustment is critical.
10. Change signal generator from 8,200 to 8,300 KC., keeping signal voltage constant. Adjust primary of discriminator (see instructions of RJ-20 for location) so that equal and opposite voltages are developed.
11. Set signal generator at 8,250 KC. and check to see if VTVM reads zero as the primary adjustment may have changed the secondary. Readjust for zero.

ALTERNATE METHOD OF ADJUSTING THE PRIMARY OF THE DISCRIMINATOR

10A. Connect VTVM between ground and the junction of R47 and R48. Set signal generator at 8,250 KC. Adjust primary of discriminator for maximum DC voltage as read by VTVM.
11A. With signal generator set at 8,250 KC. and VTVM connected between ground and junction of R50 and C45, check to see that secondary of the discriminator transformer is tuned so that VTVM reads zero.

© John F. Rider

MODELS RJ-20,
RJ-22, Tuners

ADJUSTMENTS OF FM OSCILLATOR, RF, AND MIXER CIRCUITS

12. Feed a signal of about 105 MC. from a signal generator to the antenna of the receiver. With the VTVM connected between ground and the lower end of the 1. meg. resistor (R53), see if the oscillator frequency is so set that the dial reading is in accordance with the received frequency; that is, maximum VTVM reading should be obtained when receiver dial is set at the same frequency as the signal generator. If not, adjust padder (see RJ-20 instructions for position) slightly so that frequencies marked on dial correspond to that of the signal generator (it is assumed that the signal generator is on frequency - this can be checked with FM stations.)
13. Adjust RF and mixer (for location see RJ-20 Tube Layout) trimmers for maximum reading. The RF stage will be found to be much broader than the mixer which is relatively sharp.

AM SECTION

EQUIPMENT EMPLOYED:

a. Signal generator covering 465 KC. and frequencies from 500 to 1600 KC.
b. A DC vacuum tube voltmeter which has an input resistance of more than three megohms.

IF-AM ALIGNMENT - Band Switch to AM Position.

14. Set "Broad" - "Narrow" Switch to "Narrow" (position counter-clockwise).
15. Connect signal generator between ground and pin 8 of 6SA7 (this point is most conveniently reached by connecting to the stator plates of the middle section of the three gang AM tuning condenser). Set signal generator to 465 KC.
16. Connect VTVM between ground and the lower end of R16 (0.2 meg. resistor for AVC).
17. Adjust AM-IF transformers for maximum response. It will be found that the adjustment of T2 is quite sharp. T3 is much broader.
18. Switch "Broad" -"Narrow" switch to "Broad" position. Change signal generator 3. KC. either side of 465. KC., i.e. from 462. to 468 KC. Observe VTVM reading as signal is changed. The IF response should be nearly symmetrical with two peaks and a small valley between them. If not, slight adjustments may be made on T3.
19. Switch to "Narrow" position and set signal at 465 KC. and see if sharp resonance curve has been altered. If necessary, peak again by adjustments on T2. Successive adjustments of 18 and 19 may be required. If visual method is used, observation makes adjustments relatively easy.

ADJUSTMENTS OF AM OSCILLATOR, RF, AND MIXER CIRCUITS

20. Feed a signal from signal generator into the AM antenna. Set signal generator at 1300 KC. With VTVM connected on AVC circuit as per 16, set oscillator trimmer, if necessary, so that dial reads 1,300 KC. when maximum response is obtained.
21. Set signal generator at 1400 KC. and adjust RF and mixer trimmers for maximum response. Keep signal low enough so AVC voltage will not exceed 3 or 4 volts.
22. Set signal generator to about 600 KC. Adjust AM padder for maximum response by changing the frequency from signal generator a few KC. either way and observing VTVM.

PUSH BUTTON SET UP

1. If the station you select for one of the buttons falls between 1600 to 1000 kilocycles be sure that the pin jack is in the upper strip.
2. Adjust the brass screw at the side of the lower trimmer unitl the wanted station is heard most clearly.
3. Adjust the lower trimmer screw for maximum volume.
4. Press Manual button making certain the station is still tuned in; check this reception against the reception on the button just set up. If it is the same proceed with the next station on the list.
5. If the station you desire to pick up falls between 1000 and 550 kilocycles, you must remove the pin jack and place in the hole provided at the bottom edge of the upper trimmer (see figure 1).
6. Turn the upper trimmer screw back until the screw is off the trimmer plates.
7. Adjust the brass screw until the wanted station is heard most clearly.
8. Then adjust the lower trimmer until maximum volume is secured; if maximum volume cannot be had and the lower trimmer screw is down tight you must finish tuning with the upper trimmer screw.

ALIGNMENT INSTRUCTIONS

An output meter and a signal generator are required for proper alignment of these sets. The oscillator should be calibrated at the following points, 455 Kc, 600 Kc, 900 Kc, 1400 Kc, 1600 Kc, 2.0 Mc, 5 Mc, 5.5 Mc, 6 Mc, 9.5 Mc, 12 Mc, 16 Mc, and 18.0 Mc. Always keep the output of the signal generator as low as possible to prevent A.V.C. action and false settings. Connect the high side of the generator to the antenna terminal and the low side of it to the ground terminal.

ALIGNMENT OF M-2, M-3 FM BAND

Following are described two (2) methods for the Alignment of the F.M. Band.

Method 1 will require the use of a Cathode Ray Oscilloscope, a sweep frequency generator providing a fundamental frequency at 4.3 Mc and a deviation of at least 150 Kc and also a signal generator with a fundamental high frequency range of 42-50 Mc.

As an indicating device, a meter with at least 10 Meg. ohm internal resistance can be used or as a second choice - a low range micro-ammetor with a 1 Meg. ohm resistor in series.

Method 2 will require the same equipment with the exception of the Oscilloscope and the 4.3 Mc sweep generator.

ALIGNMENT BY METHOD 1

Connect the vertical deflection input of the oscilloscope with a 1 Meg. ohm resistor in series to the grid of the limiter tube. Care must be exercised to maintain the connection of the resistor to the grid of the limiter tube as short as possible to avoid regeneration. The ground terminal of the oscilloscope must be connected to the chassis.

Limiter Alignment - Connect the ground terminal of the 4.3 Mc I.F. sweep generator to the chassis. Connect the output of the signal generator to the grid of the second I.F. tube with a .1 Mfd. paper condenser in series, adjust the deviation control of the generator for a usable picture on the oscilloscope screen, with the input control of the oscilloscope set at maximum gain. Detune the secondary trimmer of the limiter transformer, adjust the primary trimmer until you obtain a pattern as shown in Figure 1 of the oscilloscope photos. Then adjust the secondary trimmer until you obtain a pattern as shown in Figure 2. The pattern should be kept centered in the oscilloscope screen.

Align 2nd I.F. - Move the signal generator to the grid of the 1st I.F. tube and repeat the same procedure as just described for the limiter stage.

Align 1st I.F. - Move the signal generator to the grid of the Mixer tube and repeat the same procedure as just described for the limiter stage.

Align Discriminator - Connect the oscilloscope to the Cathode of the 6H6 F.M. detector which is not grounded. Connect the signal generator to the secondary of the limiter transformer as indicated by A in Figure 6. Adjust the secondary trimmer of the discriminator transformer with an insulated screw driver, for pattern as in Figure 2, then adjust the primary trimmer to obtain symetrical and linear trace and centering the picture on the oscilloscope screen. It will be necessary to go over the primary and secondary trimmer several times to adjust the stage accurately.

R.F. Alignment F.M. Band - Connect the high frequency generator to the regular terminal with a 400 ohm carbon resistor in series. Make certain the F.M. antenna Selector Switch is in regular position.

Set the signal generator at 50 Mc and adjust the Oscillator trimmer for correct dial calibration at this frequency. Connect high resistance Voltmeter to point A, Figure 4 and then adjust the signal generator to 49.5 Mc adjust the mixer and the R.F. Trimmers for maximum deflection of the meter.

Another indicating device for the R.F. alignment - connect a 0-1 millameter between point A and ground or a low range micro-ammeter with a 1 Meg. ohm resistor as series between C and ground. Tune for maximum deflection of the meter.

Lacking the above meters, the R.F. and Mixer alignment may be trimmed for minimum noise on signal. To avoid false peak when aligning the Mixer and the R.F. Trimmers the gang condenser must be rocked through the signal.

©John F. Rider

MODELS M-2FM,
M-3FM Series

ALIGNMENT OF M-2, M-3 FM BAND (Continued)

ALIGNMENT BY METHOD 2

Limiter Alignment - Connect one of the indication meters as shown in Figure 4 or Figure 5.

Feed a 4.3 Mc signal through .1 Mfd. paper condenser to the grid of the second I.F. tube. Place a 1000 ohm carbon resistor across the secondary of the limiter transformer then tune the primary for maximum meter deflection. Remove the 1000 ohm carbon resistor from the secondary and place it across the primary and tune the secondary maximum meter deflection.

To check how accurate this stage has been aligned tune the signal generator 75 Kc each side of 4.3 Mc. Only a slight loss in maximum meter deflection should be noted.

Align 2nd I.F.F.M. - Move the signal generator to the grid of the 1st I.F. tube and repeat the same procedure described above for the limiter stage.

Align 1st I.F.F.M. - Move the signal generator to the grid of the mixer tube and repeat the same procedure as described above for the limiter stage.

Discriminator Alignment - Connect a meter to Point A as shown in Figure 6 to the ungrounded Cathode.

Feed a 4.3 Mc signal to the grid of the second I.F. tube.

With an insulated screw driver turn the the secondary trimmer screw for maximum and minimum capacity. You will note that there are two points where you have maximum meter deflection. Tune to the point between the the maximum meter deflections where the meter will read as near zero as possible.

Tune the signal about 150 Kc each side of 4.3 Mc. You will note that the meter deflection rises about equal distance each side of 4.3. Mc. Tune the primary trimmer until you have maximum meter deflection and equal distance each side of 4.3 Mc.

Note: The meter will have to be reversed when reading the other side of the signal.

It will be necessary to go over the primary and secondary trimmers several times to accurately align this stage.

R.F. Alignment FM Band - Connect the high frequency generator to the regular terminal with a 400 ohm carbon resistor in series. Make certain the FM antenna Selector Switch is in regular position.

Set the signal generator at 50 Mc and adjust the Oscillator trimmer for correct dial calibration at this frequency. Connect high resistance Voltmeter to point A, Figure 4 and then adjust the signal generator to 49.5 Mc adjust the mieer and the RF Trimmer for maximum deflection of the meter.

Another indicating device for the RF alignment - connect a 0-1 millameter between point A and ground or a low range micro-ammeter with a 1 Meg. ohm resistor as series between C and ground. Tune for maximum deflection of the meter.

Lacking the above meters, the RF and Mixer alignment may be trimmed for minimum noise on signal. To avoid false peak when aligning the Mixer and the RF Trimmers the gang condenser must be rocked through the signal.

Note: If a high frequency signal generator is not available a standard signal generator which will give good harmonic output between 42 - 50 Mc can be used.

Several methods of using a micro-ammeter or a V.T. voltmeter may be used for the alignment of the discriminator are shown in figure 7.

PUSH BUTTON SET UP

1. If the station you select for one of the buttons falls between 1600 to 1000 kilocycles be sure that the pin jack is in the upper strip.
2. Adjust the brass screw at the side of the lower trimmer until the wanted station is heard most clearly.
3. Adjust the lower trimmer screw for maximum volume.
4. Press Manual button making certain the station is still tuned in; check this reception against the reception on the button just set up. If it is the same proceed with the next station on the list.
5. If the station you desire to pick up falls between 1000 and 550 kilocycles, you must remove the pin jack and place in the hole provided at the bottom edge of the upper trimmer (see figure 1).
6. Turn the upper trimmer screw back until the screw is off the trimmer plates.
7. Adjust the brass screw until the wanted station is heard most clearly.
8. Then adjust the lower trimmer until maximum volume is secured; if maximum volume cannot be had and the lower trimmer screw is down tight you must finish tuning with the upper trimmer screw.

ALIGNMENT INSTRUCTIONS

An output meter and a signal generator are required for proper alignment of these sets. The oscillator should be calibrated at the following points, 455 Kc, 600 Kc, 900 Kc, 1400 Kc, 1600 Kc, 2.0 Mc, 5 Mc, 5.5 Mc, 6 Mc, 9.5 Mc, 12 Mc, 16 Mc, and 18.0 Mc. Always keep the output of the signal generator as low as possible to prevent A.V.C. action and false settings. Connect the high side of the generator to the antenna terminal and the low side of it to the ground terminal.

MODEL M-4

ALIGNMENT INSTRUCTIONS

AN OUTPUT METER AND A SIGNAL GENERATOR ARE REQUIRED FOR PROPER ALIGNMENT OF THESE SETS. THE OSCILLATOR SHOULD BE CALIBRATED AT THE FOLLOWING POINTS, 455 Kc, 600 Kc, 900 Kc, 1500 Kc, 1720 Kc, 9.5 Mc, 12 Mc, 16 Mc AND 18.1 Mc. ALWAYS KEEP THE OUTPUT OF THE SIGNAL GENERATOR AS LOW AS POSSIBLE TO PREVENT A.V.C. ACTION AND FALSE SETTINGS. CONNECT THE HIGH SIDE OF THE GENERATOR TO THE ANTENNA TERMINAL AND THE LOW SIDE OF IT TO THE GROUND TERMINAL MAKING CERTAIN JUMBER ON TERMINAL STRIP IS DISCONNECTED. BEFORE ALIGNING TIGHTEN WAVE TRAP TRIMMER SCREW.

TABULATION FOR ALIGNMENT

STEPS	IN SERIES WITH ANTENNA	SET GENERATOR AT	SET GANG AT	ADJUST	LOCATED	TO OBTAIN
1	250 M.M.F.	455 Kc.	Note A	2nd I.F. Trimmers	Top of I.F. Trans.	Max. Output
2				1st I.F. Trimmers

17				B.S. Mixer Padder		
18				B.S. Ant. Padder		
19	RECHECK	12 Mc.				

AFTER POINTER HAS BEEN SET ON BC AND CALIBRATION CHECKED: WITH RANGE SWITCH ON BAND SPREAD (FULL CCW) SET CONDENSER SO POINTER IS ON 12 Mc ON "FOREIGN SPREAD BAND." SET "SPREAD BAND" OSC. TRIMMER FOR MAXIMUM OUTPUT. CHECK FOR IMAGE ON 11.1 Mc (A WEAK SIGNAL SHOULD BE HEARD). ALIGN RF AND ANTENNA BAND SPREAD TRIMMERS FOR MAXIMUM SIGNAL. TURN CONDENSER SO POINTER IS ON 9.5 Mc, ADJUST SPREAD BAND OSC. PADDER FOR MAXIMUM SIGNAL. CHECK FOR IMAGE. (NO SIGNAL SHOULD BE HEARD ON 10.4 Mc). ALIGN RF AND ANTENNA BAND SPREAD PADDER FOR MAXIMUM SIGNAL. GO BACK TO 12 Mc AND REPEAT ABOVE. IF SUCH READJUSTMENT HAS TO BE MADE ON TRIMMERS, THE PADDERS MUST BE CHECKED AGAIN. GREAT CARE MUST BE TAKEN IN ADJUSTING BAND SPREAD TRIMMERS. IMAGES MUST BE CHECKED. A FIBRE SCREWDRIVER MUST BE USED TO ADJUST BAND SPREAD.

*TIGHTEN OSCILLATOR TRIMMER SCREW FOR MAXIMUM CAPACITY, THEN UNSCREW UNTIL SECOND PEAK IS SECURED.

**TIGHTEN RF TRIMMER SCREW FOR MAXIMUM CAPACITY, THEN UNSCREW UNTIL FIRST PEAK IS SECURED.

NOTE A. SET GANG AT MINIMUM.

NOTE B. STRONGEST SIGNAL AND ROCK GANG.

TO SET PUSH BUTTONS

ALLOW SET TO WARM UP BEFORE SETTING UP THE BUTTON TUNING. EACH BUTTON COVERS THE ENTIRE BROADCAST BAND. TO SET ANY STATION BUTTON PRESS THE STATION BUTTON ON THE CONTROL PANEL. ADJUST THE LOWER ONE OF THE TWO SCREWS BEARING THE SAME NUMBER AS THE STATION BUTTON, UNTIL THE DESIRED STATION IS HEARD MOST CLEARLY. ADJUST UPPER SCREW UNTIL MAXIMUM VOLUME IS OBTAINED.

MODEL 400-K Series

ALIGNMENT INSTRUCTIONS A M BANDS

AN OUTPUT METER AND A SIGNAL GENERATOR ARE REQUIRED FOR PROPER ALIGNMENT OF THESE SETS. THE OSCILLATOR SHOULD BE CALIBRATED AT THE FOLLOWING POINTS, 455 Kc, 600 Kc, 900 Kc, 1400 Kc, 1600 Kc, 6 Mc, 10 Mc, 16 Mc, AND 18.0 Mc. ALWAYS KEEP THE OUTPUT OF THE SIGNAL GENERATOR AS LOW AS POSSIBLE TO PREVENT A.V.C. ACTION AND FALSE SETTINGS. CONNECT THE HIGH SIDE OF THE GENERATOR TO THE ANTENNA TERMINAL AND THE LOW SIDE OF IT TO THE GROUND TERMINAL.

A SIGNAL GENERATOR AND OUTPUT INDICATOR ARE ALL THE EQUIPMENT WHICH IS NECESSARY FOR THE ALIGNMENT OF THIS TUNER ON THE TWO AMPLITUDE MODULATED BAND.

TABULATION FOR ALIGNMENT

MODEL 400-K Series

ALIGNMENT OF FM BAND 400-K

An oscilloscope and a frequency modulated signal generator, which includes the range of 42 to 50 MC on fundamentals and has provisions for sweeping the signal 150 KC (75 KC each side) of the fundamental are necessary for proper alignment.

Connect the oscilloscope to the output cathode of the 6H6 discriminator tube (See A & B). Feed a 4.3 MC signal to the grid of the limiter tube through a .1 Mfd. paper condenser; adjust the input signal until some indication is apparent on the oscilloscope; then adjust the secondary trimmer of the discriminator transformer until the scope pattern crosses in the center of the cross section area. Adjust the primary trimmer until both halves of the pattern are equal in amplitude and as symmetrical as possible, show expected curve. Re-adjust the secondary so the pattern crosses in the center of the cross section area.

Connect the oscilloscope to the grid terminal of the limiter tube through a 1 Meg. resistor. Feed a 4.3 MC signal to the grid of the second I.F. tube through a .1 Mfd. condenser. Detune the secondary of the limiter transformer by loosening the trimmer screw, then adjust the primary for resonance hump, center on the vertical center line of the scope. Adjust the secondary trimmer until the pattern on the scope becomes flat topped and centered, show expected curve.

Advance the signal generator to the grid of the first I.F. tube, detune the secondary of the second I.F. transformer. Adjust the primary for maximum scope output still maintaining symmetrical pattern. Adjust the secondary for maximum output maintaining the flat topped pattern on the scope screen.

Advance the signal generator to the grid of the converter tube and repeat the above operations for the first I.F. F.M. transformer.

Care must be taken and not adjust the A.M. I.F. transformers after they have been aligned for A.M.

Apply a 50 MC signal to the antenna terminal through a 100 ohm carbon resistor and tune the receiver to this frequency. Adjust the oscillator mixer and the antenna trimmers for maximum output on the scope.

Check for calibration at 42 MC and 50 MC.

If the above equipment is not available, the following equipment may be used:

A standard signal generator.
A D.C. type vacuum tube voltmeter.
A 0-1 milliammeter or micro-ameter may be used for an output indicator.

When aligning the discriminator the output indicator must be placed in the circuit as shown in the diagram. The secondary of the discriminator must be detuned by placing a small mica (100 MMF) condenser across the secondary of the discriminator transformer. The primary of the discriminator may be adjusted for maximum output. Then remove the condenser across the secondary and tune for minimum output.

The balance of the alignment may be carried out in the same manner as before described, aligning for maximum leaving the output indicator in the limiter grid circuit.

When using a standard signal generator, the signal should be unmodulated.

Drawings below indicate the method of connecting the meters for alignment of the limiter and discriminator stages.

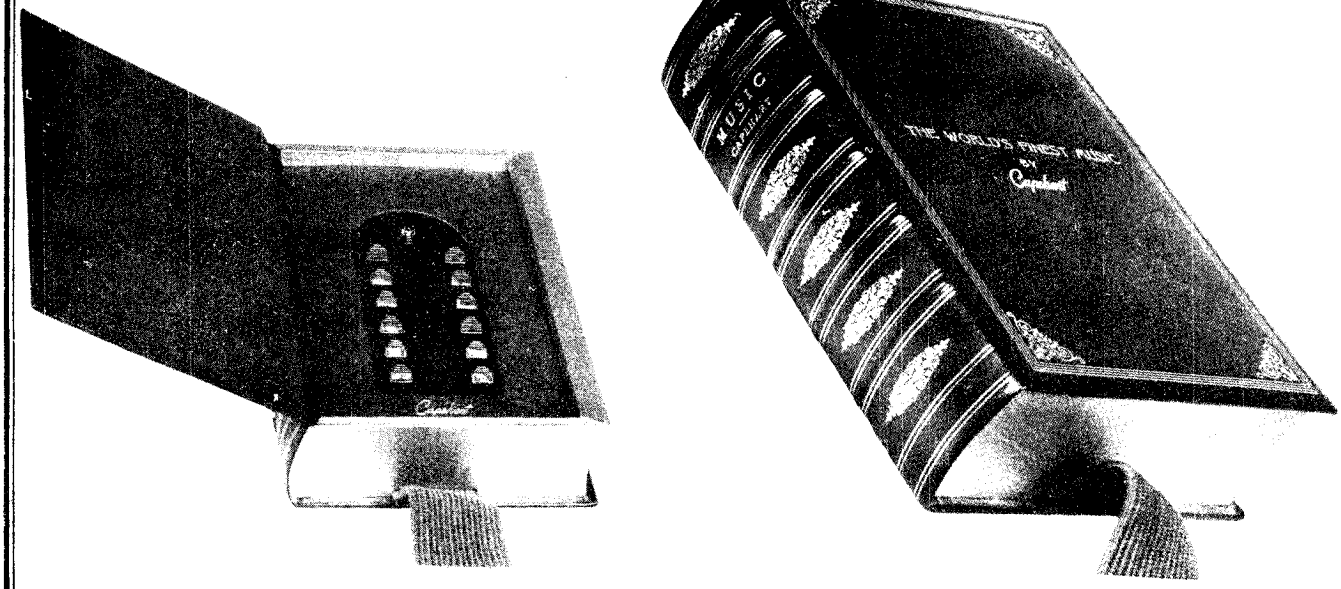
MODEL 400M, Extended
and Remote Control



These illustrations show the leather bound Book Cover available to conceal the Control Station Unit. This is covered with genuine red snuffed cowhide with gold leaf decorations and letters. The construction is rigid and the binding servicable. Its styling is such that it is a fitting accessory for the most luxurious livingroom or library, music room or bedside.

EQUIPMENT TABULATION

PART NO.	DESCRIPTION	WHERE USED	ASSOCIATED EQUIPMENT	QUANTITY PER INSTALLATION
MR-1	Line Amplifier Junction Box	In Instrument Cabinet	1 ESM up to 3 RSM	1
MR-2	Auxiliary Junction Box	In Instrument Cabinet	With MR-1 Up to 6RSM	1
MR-2A	Auxiliary Junction Box	In Instrument Cabinet	With MR-2 Up to 10 RSM	1
61251	15 Prong Plug	RSM Patch Cords	Patch Cords	2 Per Patch Cord
80-171	Pol. "A" 15 Prong Plug	ESM Patch Cords	Patch Cords	2
66344	15 Prong Female Box Cover	In wall at Inst.	ESM Patch Cord	1 Per Patch Cord
80-194	Pol. "A" 15 Pr. Female Box Cover	In wall at Inst.	RSM Patch Cord	1
80-85 *	18 Pr. Plug	At MR-3	RSM	1 Per Room
80-140*	18 Pr. Female Box	In wall	RSM	1 Per Room

*These last two items are only required when it is desirable to locate the RSM away from the MR-3 Control Unit and employ concealed wiring, instead of the flat cable.

MODEL 400M, Extended and Remote Control

CAPEHART CONTROL SYSTEMS

For many years it has been possible to adapt Capehart DeLuxe instruments for either Extended or Remote Control, i.e., facilities for operating the instrument from another location in the room or the use of extension speakers in other parts of the home with associated controls for tuning, regulating volume and changing from radio to phonograph, etc. In all instruments prior to the "K" Series the output transformer of the Bass and Treble amplifiers were designed to permit the use of additional speakers and by means of relays the program was distributed to the various extension speakers. The main disadvantage to this system was that the volume at a remote position could never exceed the volume at the instrument and no control of tone was possible except at the instrument.

All previous design limitations were corrected in the development of the "K" Series Instruments. In the "K" and the "M" Series the tuner supplies a signal to a line amplifier, the output of this amplifier (low voltage and low current) is fed to the various remote amplifiers each of which is equipped with Volume, Bass and Treble Controls so at any Remote Position the program may be reproduced at any volume and tone blending the listener desires.

CAPEHART EXTENDED CONTROL

The Extended Control Station is available in a molded plastic case or this unit may be concealed in a genuine leather "Book Cover." The Extended Control Station is regularly equipped with a 20' length of flat cable for ease of installation under rugs or carpet. This unit may be quickly plugged into a receptacle provided on all the 400M Series tuners if no remote control stations are desired or into the Line Amplifier and Junction Box if remote control equipment is used. This Junction Box is mounted in the cabinet.

Each Extended Control Station is equipped with the following control buttons:

1 for Turning Instrument On
6 for Preselected Radio Stations
1 for Phonograph
1 for Record Reject
1 for Increasing Volume
1 for Decreasing Volume
1 for Turning the Entire System Off

The Extended Control Station affords complete control of the instrument from any position in the room with the exception of Bass Volume and Treble Volume. Special lengths of cable for the Extended Control Station up to 200' will be supplied on special order. We advise against the practice of installing an outlet box and cover for the Extended Control Station connected to the junction box by a 16 wire conductor round cable run through the walls as this circuit is not fused and, therefore, does not meet Underwriters requirements.

The leather Book Covers for either the Extended or Remote Control Station units are finished in a dark red genuine snuffed cowhide binding decorated with gold leaf banding and lettering. These Book Covers are done in excellent taste and will satisfy the most discriminating buyer. We recommend they be supplied with all extended and remote control stations.

CAPEHART REMOTE CONTROL

The Remote Control Station employs the same push button control as the Extended Control unit. This is also regularly furnished with a 20' length of flat cable. The difference being that it incorporates a different connecting plug and circuit. The buttons on the Remote Control station affords the following controls:

1 to turn Remote Control On (and instrument if it is off)
6 Buttons for Preselected Stations
1 Button for Phonograph
1 Button for Record Reject
*1 Button for Increasing Volume
*1 Button for Decreasing Volume
1 Button for Turning Entire System Off

NOTE: The two buttons so marked * do not affect the main instrument or any other remote position which may be operating at the same time.

When the main instrument is on, pressing the "On" button at a remote station, lights the pilot light in the Remote Control Station and only then are the other eleven buttons active. When the system is turned off, either from the instrument or a remote control station, all remote positions are disconnected from the line, to restore the same program at any station it is only necessary to press the "On" button at that Remote Station.

MODEL 400M, Extended and Remote Control

EXPLANATION OF LAYOUT

A rear view of the 400 instrument is given to show the location of the MR-1, Junction Box and Line Amplifier. The letters A, B, C, and D designate the type sockets and their uses (A - Extended Control, B, C and D Remote Controls). Thus the MR-1 allows the operation of an Extended Control Station (ESM) and up to three Remote Control Stations. If more than three Remote Stations are desired it is necessary to add a MR-2 for the next group of three Remote Controls and for an additional group of four a MR-2A. Ten Remote Stations being the maximum possible from one instrument.

From each socket in the MR-1 or MR-2's a patch cord of 16 wire round cable terminated in the proper plugs runs to a wall socket from each position. From the wall sockets a 16 wire round cable runs to each Remote Control Station. In addition a two wire twisted pair (for the signal) is used from each of the wall sockets to the Remote Control Stations. At Remote Control Station the 16 wire cable and the signal pair terminate in a 15 wire female plug, which is furnished with the MR-3. The MR-3 is an intergal part of the SM-3, SM-2, SM or SM-5 equipment. An 18 wire female socket is incorporated in the MR-3 for the Remote Control Station. The Remote Control Station may be used in another part of the room (away from the Speaker and Amplifier), in this event a length of 16 wire cable and an 18 prong plug and an 18 prong wall outlet will be required.

REMOTE STATION EQUIPMENT

Each Remote Control Station consists of a MR-3; an amplifier, SM-3 is 10 watts, SM-2 is 20 watts, SM is 40 watts, SM-5 is 20 watts, and a speaker unit with the baffle, SM-3 uses the 12" speaker as used in the Panamuse M-3, the SM-2 uses the two 12" speakers as in the M-2, the SM uses the 12" and 14" speakers from the 400-M and the SM-5 uses the 12" speaker from the 400-M, in each case a 24" x 24" baffle is furnished cut to fit the speaker or speakers supplied.

In other words the SM equipment consists of the two amplifiers and the two speakers as used in the 400-M. With the SM equipment an MR-4 junction box is supplied, this plugs into the MR-3 and has two A.C. outlets and two signal cables (one for each of the two amplifiers) this is necessary as the MR-3 has but one AC outlet for an amplifier and one signal cable.

The Extended Control Station may be plugged into the instrument, if no remote equipment is used. It is terminated in a 15 prong polarized male plug, this is to prevent plugging it into a Remote Socket by accident or plugging a Remote plug into the Extended Socket. The Extended Control Stations, and Remote Control Stations are equipped with a 20' flat cable and may if desired be enclosed in a book cover. See Illustration. Extra length cable will be supplied, on special order although excessive lengths are impractical; 200 feet is the maximum recommended for Extended Controls, Remote Controls should be planned for shorter lengths. This limitation is imposed by the voltage drop which prevents positive operation of the relays under low line voltage conditions.

INSTALLATION SUGGESTIONS

The question of installation of the units in walls is often raised; where space is a factor it is often possible to mount the speaker (or speakers) behind a grill let into the wall and the amplifiers on shelves in either the basement, attic or adjacent closet running leads from the speakers back to the amplifiers.

Unless a Service Department has available the services of a skilled electrician who is accustomed to installing wiring in the better homes, it is best to avail yourselves of the services of a good electrical contractor to install the concealed wiring. This results in a fixed price which can be secured before the installation is started, and which can be included in the quotation to the customer. The contractor will of course be responsible for any damage and will insure a neat

©John F. Rider

MODEL 400M, Extended and Remote Control

INSTALLATION SUGGESTIONS

and workmanlike job which will pass the local wiring code requirements.

In the event you have a prospect for a Remote Control Installation, and you are not sure of the specifications you have prepared if a floor plan of the home, with the proposal, is sent the Service, Department, Marion, Indiana, we will gladly review the installation, making such recommendations as are indicated by our national experience.

It is also possible to arrange for the services of a Field Engineer to supervise the actual installation or the final acceptance tests. Inquiries should of course be made to the Service Department.

CIRCUIT DISCUSSION

A jack is provided in the tuner to supply a signal (radio or phonograph) to the Line Amplifier and Junction Box. This unit has a power supply cable which plugs into a 5 prong socket at the rear of the tuner and also a 16 conductor cable with a polarized 15 prong plug which goes into a socket on the top of the tuner, this carries the control circuits. The signal, in the tuner is taken off ahead of the volume and tone control circuits.

In the Line Amplifier and Junction Box, MR-1, is a 6J5 amplifier tube with a plate to line transformer. The line is 33 ohms, to eliminate hum pickup and to keep the voltage low. The plate to line transformer is connected to the three remote control sockets and the socket for the Auxiliary Junction Box MR-2 which is used when more than three Remote Control Stations are used. The MR-2 does not have an amplifier as it uses the output from the MR-1, it does have, however, three sockets for Remote Control Stations and a socket for a MR-2A auxiliary junction box, which has sockets for four Remote Control Stations. Thus a total of ten Remote Stations which is the maximum that can be operated from one instrument is had by using 1 MR-1, 1 MR-2 and 1 MR-2A.

We recommend the use of a patch cord for each line from the junction box and auxiliary junction boxes to the cable outlets in the wall.

At the instrument end of each remote station cable a 15 prong outlet box cover should be installed.

Two cables are run from each outlet box to each remote position, a two wire twisted pair for the signal (this is the 33 ohm line) and the 16 wire round cable. Only 13 conductors of the 16 are used so there are three spares in case of breakage when pulling the cable in.

These two cables terminate at the Remote Amplifier and Control Unit, MR-3, in a 15 prong female plug which is furnished with the MR-3.

The MR-3 is a line to grid amplifier to drive the power amplifier. It has a line to grid transformer working into a triode thru a volume control, the bass and treble volume controls are in the plate circuit of this tube. Power for the tube is supplied by the power amplifier. In the MR-3 there is a three circuit relay, one circuit holds the relay closed after it is energized by the "On" button of the Remote Control Station. The second circuit closes the 117 Volts to the power amplifier while the third circuit interrupts all the button circuits except the "On" button, so unless the Remote position is turned on the other buttons are not effective. The volume control is motor driven so that it may be controlled either manually at the control unit or electrically from the Remote Control Station. The MR-3 is plugged into the 117 Volt and thru its relay supplies the power amplifier, which plugs into the MR-3.

TYPES OF EQUIPMENT

There are four types of power amplifier and speaker combinations.

SM is 2 - 20 watt amplifiers and a 12" speaker and a 14" speaker a 24" x 24" baffle and a MR-3. The speakers and amplifiers are identical with those used in a 400-M.

SM-5 is a 1 - 20 watt amplifier and a 12" speaker with a 24" x 24" baffle and a MR-3. The speaker is the same as the 12" used in the 400-M.

SM-3 is a 10 watt amplifier, 12" speaker and 24" x 24" baffle and a MR-3. The Amplifier and speaker are the same as those used in the M-3 Panamuse.

SM-2 is a 20 watt amplifier, twin 12" speakers with a 24" x 24" baffle and a MR-3. This equipment is identical with that used in the M-2 Panamuse.

With the SM equipment (40 watts) a MR-4 Junction Box is used, this plugs into the MR-3 and has two signal cables and two 117 Volt outlets. These are to permit the use of two amplifiers as the MR-3 has only single outlets for 117 Volts and the signal.

©John F. Rider

MODEL 400M, Extended and Remote Control

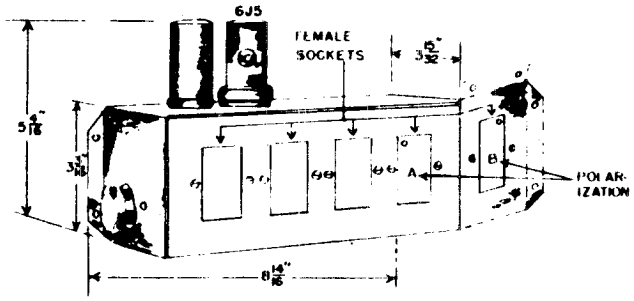
MR-1 LINE AMPLIFIER AND JUNCTION BOX

The MR-1 is called the Line Amplifier and Junction Box. It is equipped with three cables and plugs for connection to the tuner. This furnishes the heater and plate voltages for the amplifier tube through one cable which plugs into the five prong socket in the rear of the 400 tuner. The shielded cable plugs into a jack, also in the rear of the tuner, this furnishes a signal taken off before the volume or tone control circuits, thus the signal, furnished the remote speakers is unmodified by the volume or tone controls of the tuner. The 15 prong plug goes into the top of the tuner and supplies the voltages to the various control circuits, these are distributed by the five sockets in the MR-1. On one side of the unit are four 15 prong sockets, three standard and one polarized. The polarized socket is for an Extended Control Station, the other three are for Remote Positions, these three sockets are fused by a 2.5 Amp. Fusestat. On one end is another polarized socket, this is for the use of a MR-2 Auxiliary Junction Box. The supply voltage for this socket is taken off ahead of the Fusestat as the additional drain of more than three Remote Positions would blow the Fusestat.

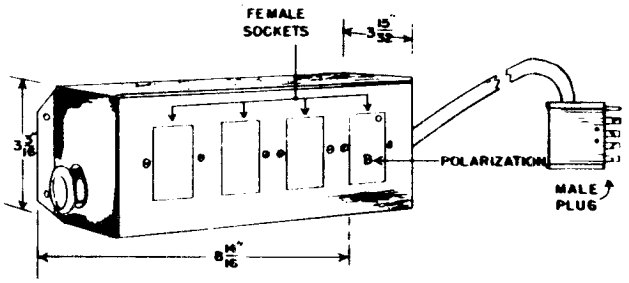
The MR-2 Auxiliary Junction Box is similar to the MR-1 except it has no Extended Control Socket or amplifier. It does have a cable and plug to connect it into the MR-1, three sockets for Remote Positions protected by a 2.5A Fusestat and a polarized socket for use with a MR-2A in the event more than six Remote Positions are required. (3 in MR-1 and 3 in MR-2). The MR-2A has four sockets for Remote Positions and is properly fused.

One MR-1 is required for each 400M instrument used with Remote Control Equipment. If the installation has more than three positions but less than seven a MR-2 is required in addition, if more than six positions are required a MR-2A is also needed. In no case should the number of speaker positions exceed ten.

MR-1 LINE AMPLIFIER and JUNCTION BOX



MR-2 JUNCTION BOX



MR-3 REMOTE AMPLIFIER AND CONTROL UNIT

The MR-3 is called the Remote Amplifier and Control Unit. It is mounted at the remote speaker position and permits control of volume, bass and treble manually at the MR-3 or the volume automatically at the Remote Control Station. This is equipped with a 15 prong male plug to terminate the signal (two wire) and control (16 wire) cables, an 18 prong socket for the Remote Control Station. A line to grid transformer feeds the grid of the triode through the motor driven volume control. Power for the triode is supplied by the power amplifier through a cord and plug. A shielded cord supplies the amplified signal to the power amplifier, which plugs into the AC receptacle in the MR-3. The MR-3 has an AC supply cord which is connected through a three pole relay to the AC receptacle and the 16 Volt transformer which operates the volume control motor, the remote station pilot lamp and holds the relay closed until the Off button is pushed which opens the relay holding circuit thus opening the AC supply to the power amplifier and the 16 Volt transformer. Thus when the system is in use pressing any button at a Remote Position, with the exception of the On button, has no effect on the system unless the position is On, this condition is indicated by the pilot light being lighted. Another feature is that when the system is turned Off all remote positions are disconnected from the line and when the instrument is restarted only the positions where the On button has been pushed again are reconnected.

Due to the fact that the MR-3 has only one signal output cable the SM Concealed Speaker Unit includes a MR-4 junction box.

This unit has a 117 Volt supply cord which plugs into the AC socket in the MR-3 and terminals in two AC outlets, a signal jack to receive the output of the signal cable from the MR-3 and terminates in two signal cables.

Thus Signal and AC Supply is furnished for each of the two power amplifiers. A power cable in the MR-4 connected to a bleeder is plugged into the amplifier not supplying the power for the MR-3 thus the voltages are equalized in the two amplifiers.

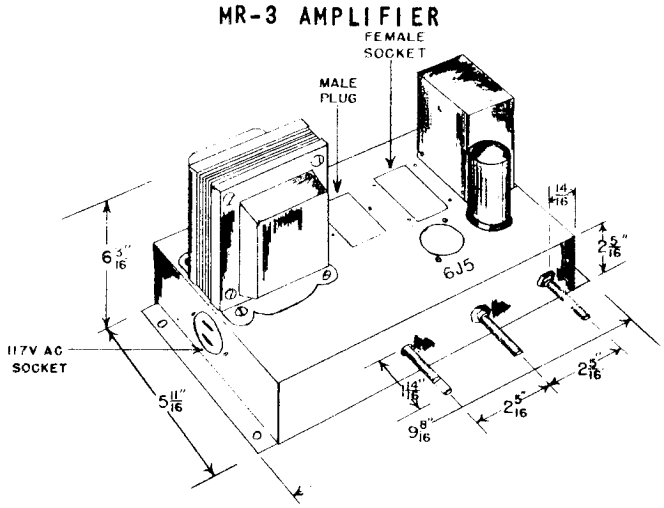
MODEL 400M, Extended
and Remote Control

MR-3 AMPLIFIER



M-2 AMPLIFIER

This nine tube, 20 watt amplifier has a 6R7 input feeding a center tapped choke for phase inverting to drive a 6C8 dual triode in push pull. This tube is resistance coupled to the push pull parallel output stage. Degeneration is carried out over two stages, from the output plates to the unbypassed cathodes of the 6C8. This degeneration minimizes the changes in impedance reflected by the output transformer from the speaker to the output tube plates, or, in other words, results in a flatter overall response from the amplifier and loudspeaker.

Three 5Y3 rectifiers are used in parallel to maintain good regulation and longer tube life as the current requirements are quite high.

A two section filter employing a 30 mfd. condenser (2 - 15 mfd., 475 Volts) a choke, another 30 mfd. condenser, speaker field (or fields) terminated in a 30 mfd. condenser, this results in a direct current supply with an exceedingly small a.c. component and no tendency to motor boat on sustained bass passages.

The M-2 amplifier is supplied in the SM-2 and SM-5 units, while two are furnished with the SM.

M-3 AMPLIFIER

This six tube, 10 watt amplifier has a 6R7 triode feeding a center tapped choke for phase inverting to drive a 6SC7 dual triode used in push pull which is resistance coupled to the push pull 6V6 output stage. Degeneration is carried over one stage, from the plate circuit of each the 6V6's to it's grid circuit.

Two 5Y3 rectifiers are used to insure good regulation and as in the case of the M-2 an adequate filter is supplied.

The M-3 is only supplied with the SM-3 unit.

MODEL 400M, Extended and Remote Control

EXTENDED CONTROL

The "M" Series Extended Control is similar in all respects to previous Extended Controls except an "On" Button is used to turn the set on. No "Dial" button provided, however the other eleven buttons correspond with those on the set: 6 Radio Stations, Off, Phono, Record Reject, Volume Increase and Volume Decrease and "On."

REMOTE CONTROL

The Series "M" Remote Control is similar to that previously used in the "K" series. In the tuner the signal either from the detector (AM or FM) or the crystal pickup is fed to a 33 ohm line thru a 6J5 tube and a plate to line transformer before it is affected by the bass, treble or master volume control. The low impedance line runs to one or more control units which have a line to grid transformer feeding the volume control for a 6J5. In the plate circuit of this tube are the bass and treble controls. This tube drives either an SM3 unit 10 watt amplifiers and a 12" and a 14" speaker, or an SM5 unit having a 20 watt amplifier and one 12" heavy duty speaker. Physically the Remote Control Station is identical with the Extended Control Station, the difference is in wiring the plug termination. The remote station uses an 18 prong plug while the Extended Station uses a 15 prong polarized plug.

We have recommended the use of a 16 wire round cable for the cable runs between the instrument and each remote amplifier, although only 13 conductors are used, this is to allow spares in case of insulation breaks or wire breaks when the cable is pulled in. A careful examination of the male and female plugs furnished with our equipment discloses the facts that the terminals are numbered so #1 of a male socket connects to #1 of a female socket, etc. Thus in making up a system, if a short piece of cable 6" or 8" long is connected to a plug it can be carried about and used for a sample at each position needing a connection.

Occasionally a tuneable hum is present in some Remote Control installations when certain positions are plugged into the Junction Box, often removing the ground connected to the blue lead on prong 14 in the 15 prong male socket will remove this condition (of course a good ground should be provided for each Remote Position). The use of a twisted pair as the signal line is recommended to prevent hum pick up which might happen if the signal lines were run in the same cable as the operating lines.

With the SK unit a Special Junction Box for use with two amplifiers is furnished.

MODEL ME8

Model ME8 Portable Radio is a 6-tube, 3-way portable superheterodyne receiver using the latest octal type of low-drain electronic tubes.

OPERATION: The set operates from 105 to 120 volts, A.C. or D.C. power supply or from self-contained batteries. Power drain is approximately 25 watts on electric operation.

When operated on direct current (D.C.), if no reception is obtained after approximately one minute of warm-up time, reverse the line plug in the power outlet.

RANGE: Model ME8 covers the broadcast band from 532 to 1700 kilocycles. Since the scale is calibrated 54 to 160, the actual frequency of the station received is obtained by adding zero to the dial calibration.

CONTROLS: Three controls are provided. The left hand control puts the set into operation and increases the volume with clockwise rotation. The right-hand control tunes the dial to the desired station. The center slide switch selects electric operation in the left position, and battery operation in the right position.

ANTENNA: No outside aerial is required as more than adequate pickup is obtained by the self-contained loop antenna. In areas of poor reception or for weak or distant stations the loop antenna has a directional effect. The set may be turned to the direction of maximum reception.

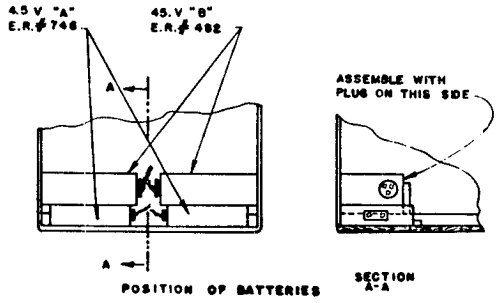
BATTERIES: The batteries comprise: two 4½ volt "A" units, Eveready type 746 or equivalent, and two 45 volt "B" units, Eveready type 482 or equivalent.

They should be mounted in the compartment provided in the bottom of the cabinet, as shown in sketch. Batteries should be removed when they are dead or if the set is not to be used on battery operation for several months.

ALIGNMENT: No attempt should be made to realign this receiver until it has been determined that a poor tube, or some local condition is not responsible for faulty reception.

The Signal Generator may be connected through a 0.01 mf capacitor (used as dummy antenna) to the lug on RF section A of tuning capacitor. Connect ground clip of generator to a convenient B-minus point (such as the case of the electrolytic capacitor, or one of the switch terminals on the back of the volume control). An output meter may be clipped directly across the voice control lugs. Align the I.F. trimmers to 455 kc, using least possible input from Signal Generator to avoid developing A.V.C. voltage which would make the tuning adjustments very broad.

To align RF trimmers, remove the 0.01 mf capacitor and connect the Signal Generator leads to two or three turns of heavy wire, forming a self-supporting loop of about 7 or 8 inches diameter, placed about a foot away from the receiver's loop antenna. Again, use the least possible input from the Signal Generator. With the tuning capacitor plates completely out of mesh, and pointer at extreme right end of travel, adjust the oscillator trimmer (B) (on front section of tuning capacitor) to 1700 kc. Readjust both Signal Generator and tuning capacitor to 1550 kc and adjust the RF trimmer (A) (on rear section) for maximum response.



NOTE:
BE SURE TO REMOVE BOLT FROM BOTTOM OF CABINET BEFORE ATTEMPTING TO INSERT BATTERIES.

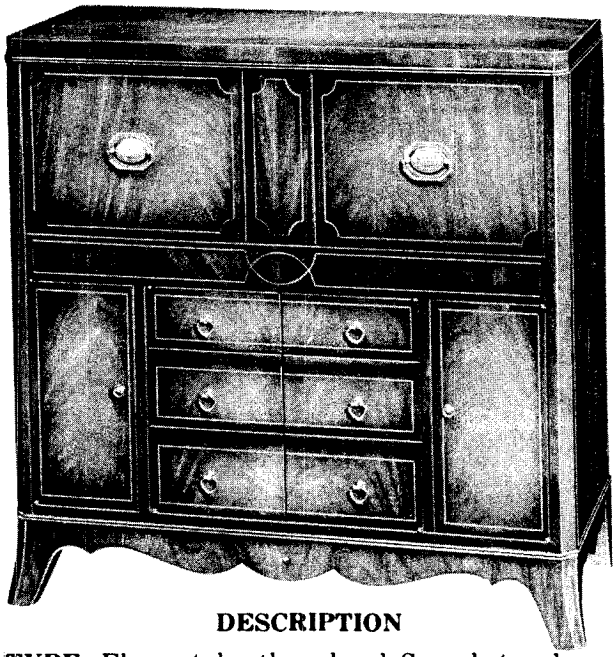
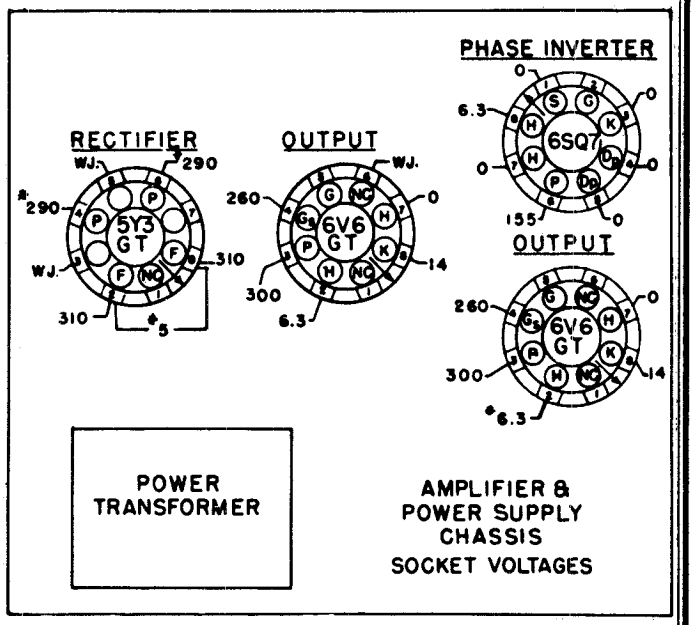
POWER SUPPLY & POWER AMPLIFIER CHASSIS.





DESCRIPTION

TYPE: Eleven-tube, three-band, Superheterodyne.

FREQUENCY RANGE: Standard Broadcast Band; 540 to 1600 kc. (Selector Switch at AM position).

Short-wave Band; 9.45 to 11.9 mc. (Selector Switch at SW position).

Frequency Modulated Band: 88 to 108 mc., Channels 201 to 300 (Selector Switch at FM position).

INTERMEDIATE FREQUENCY: Standard Broadcast Band and Short-wave Band; 455 kc. Frequency Modulated Band: 10.7 mc.

POWER SUPPLY: 60 cycle a.c. only.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 100 watts maximum; 20 watts additional for record changer.

POWER OUTPUT: 10 watts maximum.

TUBE COMPLEMENT

Type	Function

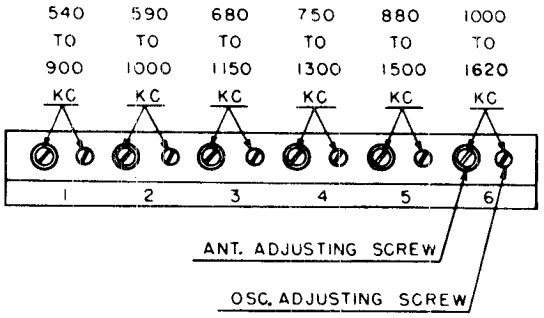
PUSH BUTTON ADJUSTMENT PROCEDURE

Each of the six push buttons, for automatic tuning, has two adjusting screws by which it may be set to any nearby American broadcast station whose frequency in kilocycles is within the kilocycle range covered by that button. To gain access to these screws, carefully pull off the push button. To set No. 1 push button to a desired position, proceed as follows:



1. Turn the ANT. ADJUSTING SCREW clockwise until moderately tight, then turn the OSC. ADJUSTING SCREW counter-clockwise until the threaded portion extends approximately $^3/_4$ inch. **Use a small screw-driver and do not exert pressure.**
2. Turn the band selector switch to the "AM" position and manually tune in the station to which the push button is to be set. The frequency of the station selected must be between 540 and 900 kilocycles. Carefully adjust the tuning control to the point of clearest reception.
3. Turn the band selector switch to the "AUTO" position and slowly turn the OSC. ADJUSTING SCREW clockwise until the same station is heard. Adjust the screw for maximum volume.
4. Adjust the ANT. ADJUSTING SCREW for maximum volume.

   NOTE: In localities where the receiver is near the transmitting station, it may be necessary to detune the ant. adjusting screw (but not the osc. adjusting screw) of the push-button slightly to keep the receiver from overloading on this station.
5. Turn the band selector switch from "AUTO" to "AM" and back again to check if the adjustment has been correctly made. There should be no change in tone quality when switched from one to the other.
6. Place the tab with the call letters of the station, to which the push button has been set, in a celluloid "V" and slide it into the button from the side.
7. The remaining push buttons may be set in a similar manner.

ALIGNMENT PROCEDURE

1. This receiver has been aligned at the factory for best performance, and no attempt should be made to re-align it unless the proper test equipment is available.
2. Turn the tuning condenser to full mesh, against stop, and set the dial pointer at the edge of the clear section of the dial, left of "55."
3. Connect an output meter across the voice coil of the speaker (3.2 ohms).
4. Turn the volume control knob to maximum clockwise position and adjust the signal generator output to produce a noticeable output meter reading. Keep the signal generator output as low as possible to prevent excessive AVC action in the receiver.
5. Feed an R.F. amplitude modulated signal modulated 30% at 400 cycle to the receiver as indicated in the alignment procedure chart. Connect signal generator ground terminal to the chassis of the receiver. When F.M. generator is used, a 30% modulated signal is equal to a deviation of 22.5 kc.
6. Both bass and treble tone controls are to be set for maximum treble response.
7. When aligning the broadcast band, the build-in loop antenna or a suitable dummy antenna, consisting of a coil with 19.1 u h. inductance shunted with a 66 mmf. capacitor must be used.
8. While aligning the set, the shorting link on the antenna terminal strip should be removed. After alignment replace the link, unless an external antenna is to be used.

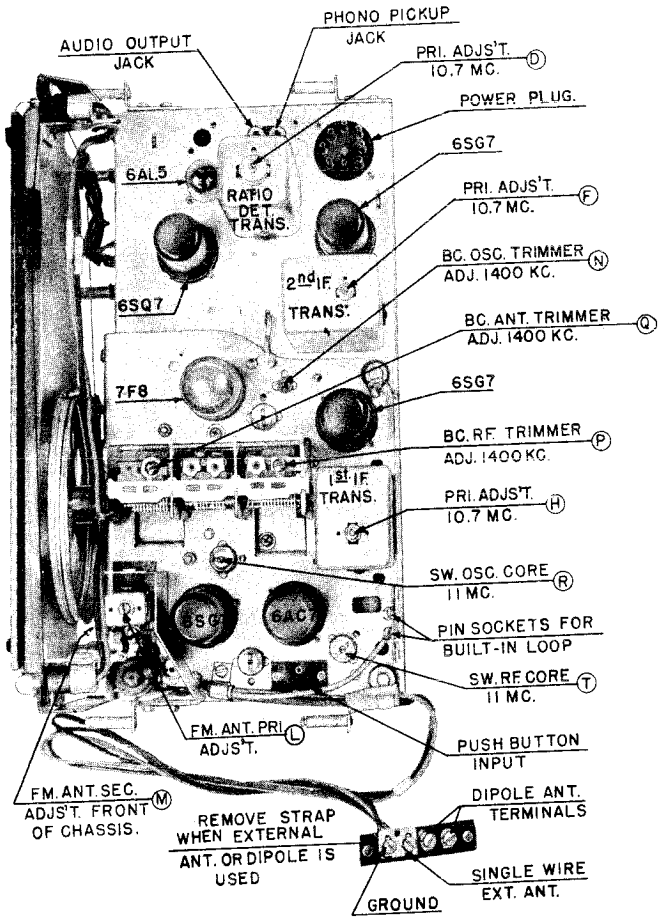
CHASSIS TOP VIEW



MODEL 9-207M

ALIGNMENT CHART I NOTES (SCOPE METHOD)

1. Align for peak on output meter.

2. Connect two 100,000 ohm resistors in series and connect these resistors from the No. 2 lug of the 6AL5 to the chassis. Connect an electronic voltmeter from the center of these resistors to the shielded lead junction of the 39,000 ohm resistor (98) and the .002 mfd. condenser, (34). Adjust the ratio detector transformer secondary (C) for zero volts on the electronic voltmeter. Remove the two 100,000 ohm resistors.

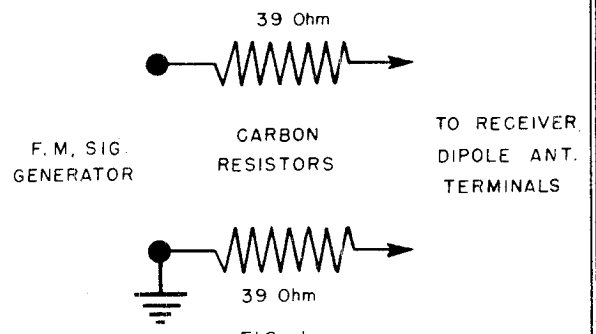


FIG. 1

3. Connect the electronic voltmeter across the 27,000 ohm load resistor (99) and adjust primary of core (D) of the ratio detector transformer (11) for maximum DC output.

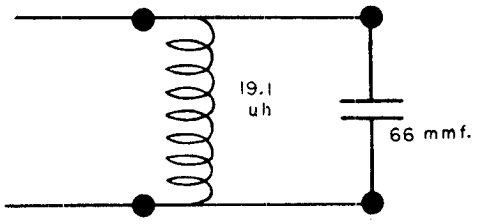

FIG. 2

4. Connect output of marker generator across sweep generator output. Connect CRO across the 22,000 ohm resistor (104) in the grid circuit of the second I.F. amplifier.

5. CRO connections same as note 4.

6. For dummy antenna see figure 1.

7. Rock gang condenser if necessary while making adjustment.

8. Tune in signal and adjust for greatest sensitivity by forming FM.—R.F. coil.

9. Connect CRO in series with 100,000 ohm resistor to grid (pin 4) of R.F. amplifier and chassis. Remove 7F8 oscillator tube. Connect output of marker generator across output of sweep generator. Adjust (L-M) until pattern and markers approximate figure in alignment chart.

9a. Shunt primary of FM antenna transformer with a 10 ohm carbon resistor and adjust (M) for maximum output. Remove shunt and place it across FM antenna transformer secondary and adjust (L) for maximum output. Remove shunt.

10. Connect BC. dummy loop (Fig. 2) across loop terminals on rear of chassis.

14	AM-RF Gen. 11 MC	400 ohms	FM Ant. Term. and ground	SW	11 MC	S & T	Note 6. Adj. for max. reading on output meter.

ALIGNMENT CHART II NOTES

1. Use an unmodulated signal generator, with approximately 100,000 mv. output.

2. Connect two 100,000 ohm resistors in series and connect these resistors from the No. 2 lug of the 6AL5 to the chassis. Connect an electronic voltmeter from the center of these resistors to the shielded lead junction of the 39,000 ohm resistor (98) and the .002 mfd. condenser, (34). Adjust the ratio detector transformer secondary (C) for zero volts on the electronic voltmeter. Remove the two 100,000 ohm resistors.

3. Connect the electronic voltmeter across the 27,000 ohm load resistor (99) and adjust the primary of the core (D) of the ratio detector transformer (11) for maximum DC output.

4. Limit output of signal generator so that the reading on the electronic voltmeter will not exceed 4 volts.

©John F. Rider

5. Shunt the FM antenna transformer primary with a 10 ohm carbon resistor, and adjust the FM antenna secondary trimmer (M) for maximum output meter reading. Transfer the 10 ohm shunt to the secondary of FM antenna transformer. Adjust FM antenna primary trimmer (L) for maximum output meter reading. Remove the 10 ohm shunt resistor.

6. Connect the BC dummy loop antenna across the loop terminals on the rear of the chassis (see Figure 2

143653	Bracket, R.H. Radio Bin
143846	Bumper, Rubber, Radio Bin
143485	Bumper, Rubber, Doors
142973	Button, Indicator
143941	Door, Speaker
143940	Doors, (matched pair), Record Comp.
143935	Frame Assy. only, Rec' Changer Draw.
143509	Grille Cloth
143942	Hinges, Record Compartment Door
137266-SB	Hinge, Speaker Door
143939	Knobs, Record Compartment Door
143944	Leg & Base Assy.
143936	Panel (matched pair) Drawer & Radio Bin
143856	Panel Assy., Radio Dial
143938	Pull, Rec'd Changer Draw. & Radio Bin
143478	Slides (one set) Rec'd Changer Drawer
143913	Spring, Radio Bin
139319	Strike & Catch Assy.

MEGACYCLES TO CHANNEL NUMBERS

Cross index between frequency calibrations in megacycles on the dial and channel numbers follow:

Frequency in Megacycles	Channel No.	Frequency in Megacycles	Channel No.
87.9	200	98.9	255
88.9	205	99.9	260
89.9	210	100.9	265
90.9	215	101.9	270
91.9	220	102.9	275
92.9	225	103.9	280
93.9	230	104.9	285
94.9	235	105.9	290
95.9	240	106.9	295
96.9	245	107.9	300
97.9	250		

To find the frequency in megacycles for CHANNEL NUMBERS between those given above, add .2 megacycle for every whole number added to the CHANNEL NUMBER; for example channel 204 would be 88.7 megacycles and 251 would be 98.1 megacycles.

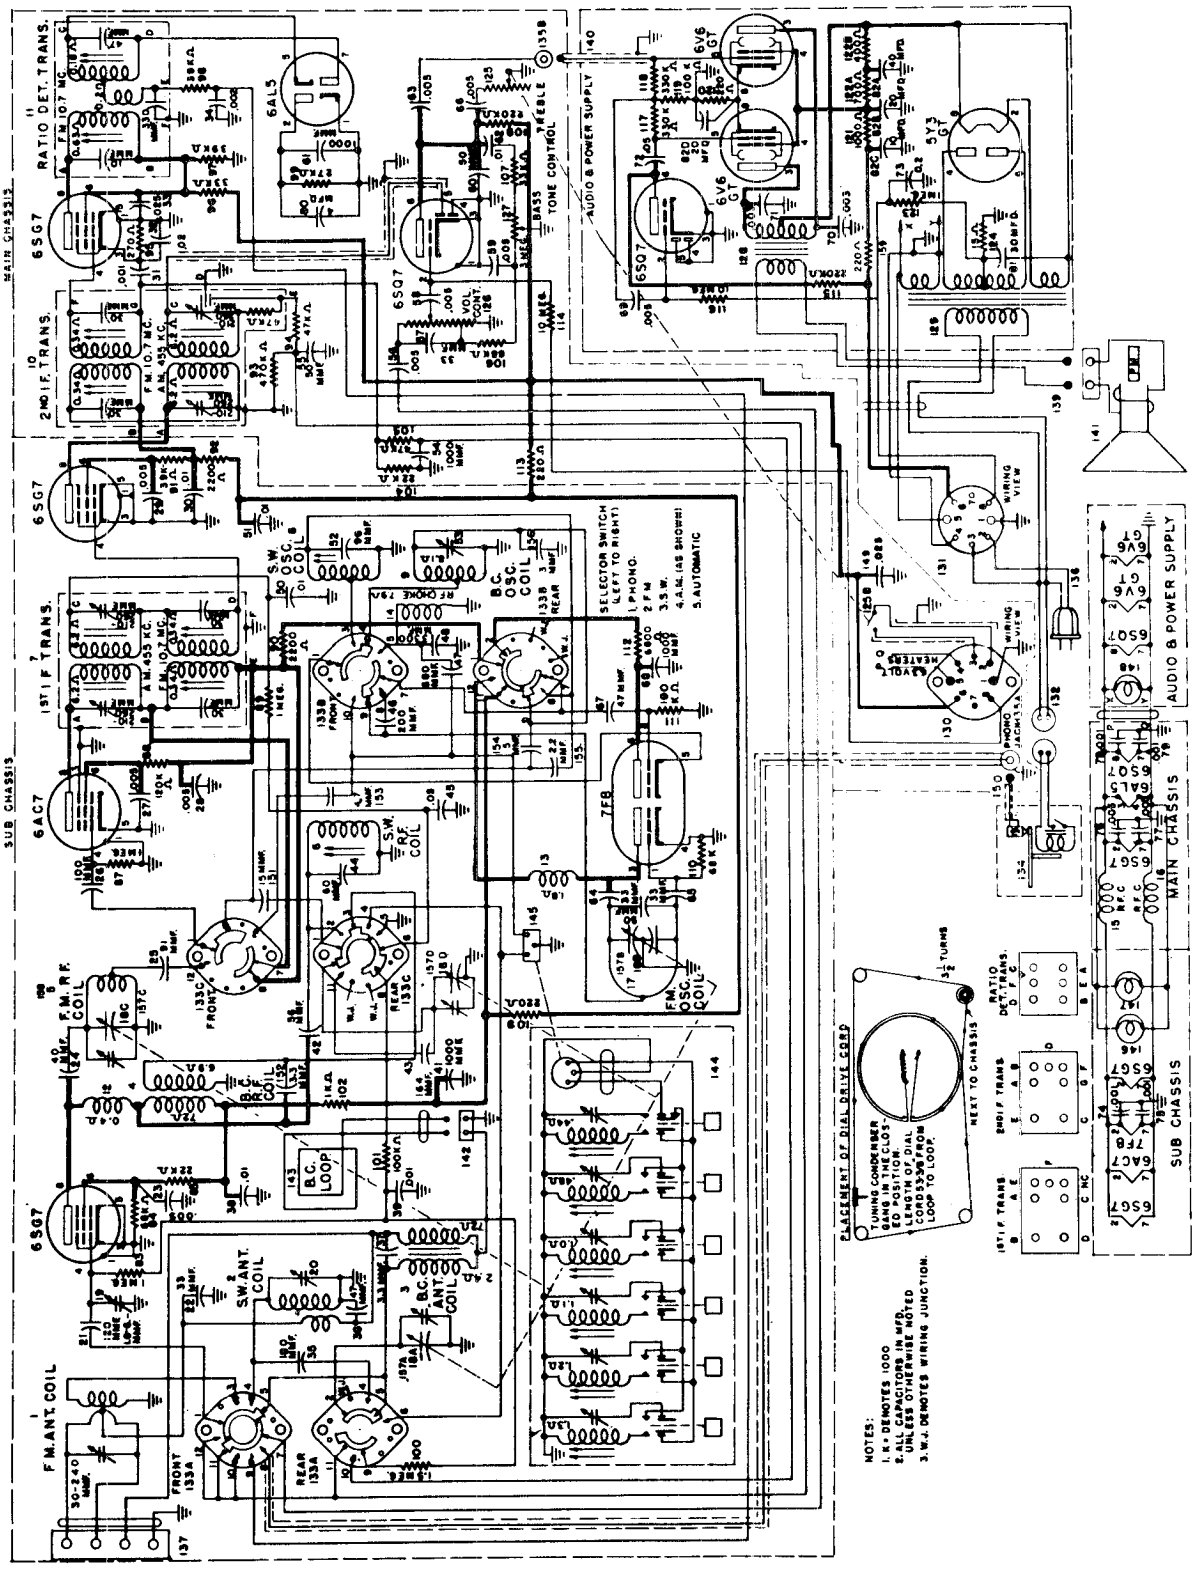
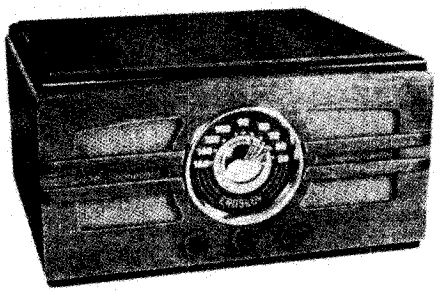
MODEL 9-207M



RECORD CHANGER: See Webster Model 156, Pages RCD.CH. 19-1 through RCD.CH. 19-11

©John F. Rider

MODEL 10-145M



DESCRIPTION

TYPE: Five-tube superheterodyne.

FREQUENCY RANGE: 540 to 1600 kc.

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: 60 cycle a.c. only.

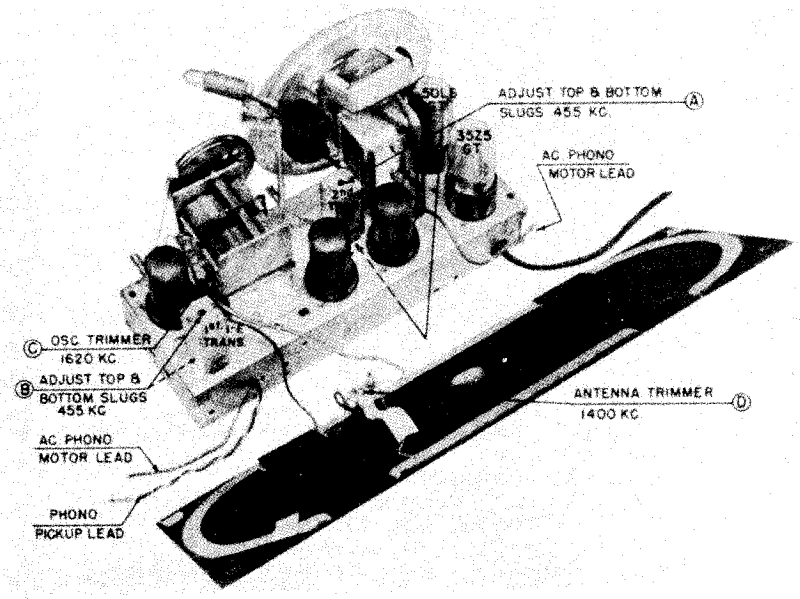
VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION:
Radio position—35 watts.
Phono position—55 watts.

TUBE COMPLEMENT:

Type	Function
12SA7	Converter
12SK7	I.F. Amplifier
12SQ7	Detector, AVC, 1st Audio Amplifier
50L6GT	A.F. Power Output
35Z5GT	Rectifier

DIAL BULB: Type 47, 6.3 volts, .15 amp.



CHASSIS, TOP VIEW—MODEL 10-145M

Reversing the position of the power plug may reduce power hum.

Under no circumstances should a ground be connected to this receiver.

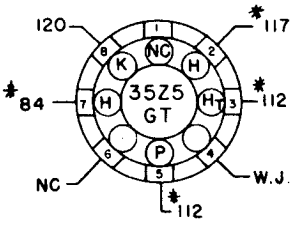
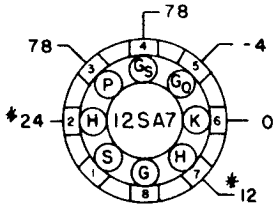
RECTIFIER

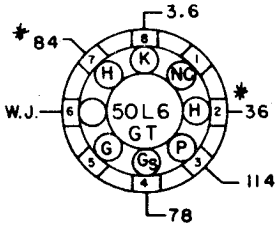


CONVERTER



NOTES:
1. BOTTOM VIEW OF TUBE SOCKETS.
2. VOLTAGES MEASURED FROM SOCKET LUG TO (B-)(PIN 4 OF 12SQ7) WITH AN ELECTRONIC VOLTMETER; TUNING GANG IN THE CLOSED POSITION WITH NO SIGNAL, VOLUME CONTROL AT MINIMUM.
3. N.C. = NO CONNECTION
4. W.J. = WIRING JUNCTION.
5. * = AC. VOLTAGE
6. SUPPLY VOLTAGE 117 V. 60 ~
7. SOCKET VOLTAGE TOLERANCE ± 10 %

OUTPUT



SOCKET VOLTAGE CHART

©John F. Rider

ALIGNMENT PROCEDURE

1. Turn the tuning capacitor to the completely closed position against the stop and set the dial pointer to the reference line at the end of the dial scale.
2. Turn tone control switch to normal tone position.
3. Connect the output meter across the speaker voice coil.
4. The r.f. signal input from the signal generator should be connected as indicated in the Alignment Chart. Connect the signal generator ground through a 0.1 mfd. capacitor to B— (pin 4 on 12SQ7 tube socket).
5. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment adjustment locations are shown on page 1, Chassis, Top View—Model 10-145M

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in kc.	In Series with	To	Radio-Phono Switch	Tuning Dial	
1	455	200 mmf.	Ant.	Counter-clockwise	Open	A & B (See Note 1)
2	1620	200 mmf	Ant.	Counter-clockwise	Open	C (See Note 1)
3	1400	*Radiated to Loop			Tune in Signal	D (See Note 2)

*Place signal generator output lead near the loop antenna.

Notes: 1. Disconnect loop antenna. Connect a 33,000 ohm resistor from pin 8 on 12SA7 tube socket to B-(pin 4 on 12SQ7 tube socket).
2. Remove 33,000 ohm resistor, connect loop antenna and place receiver chassis in cabinet.

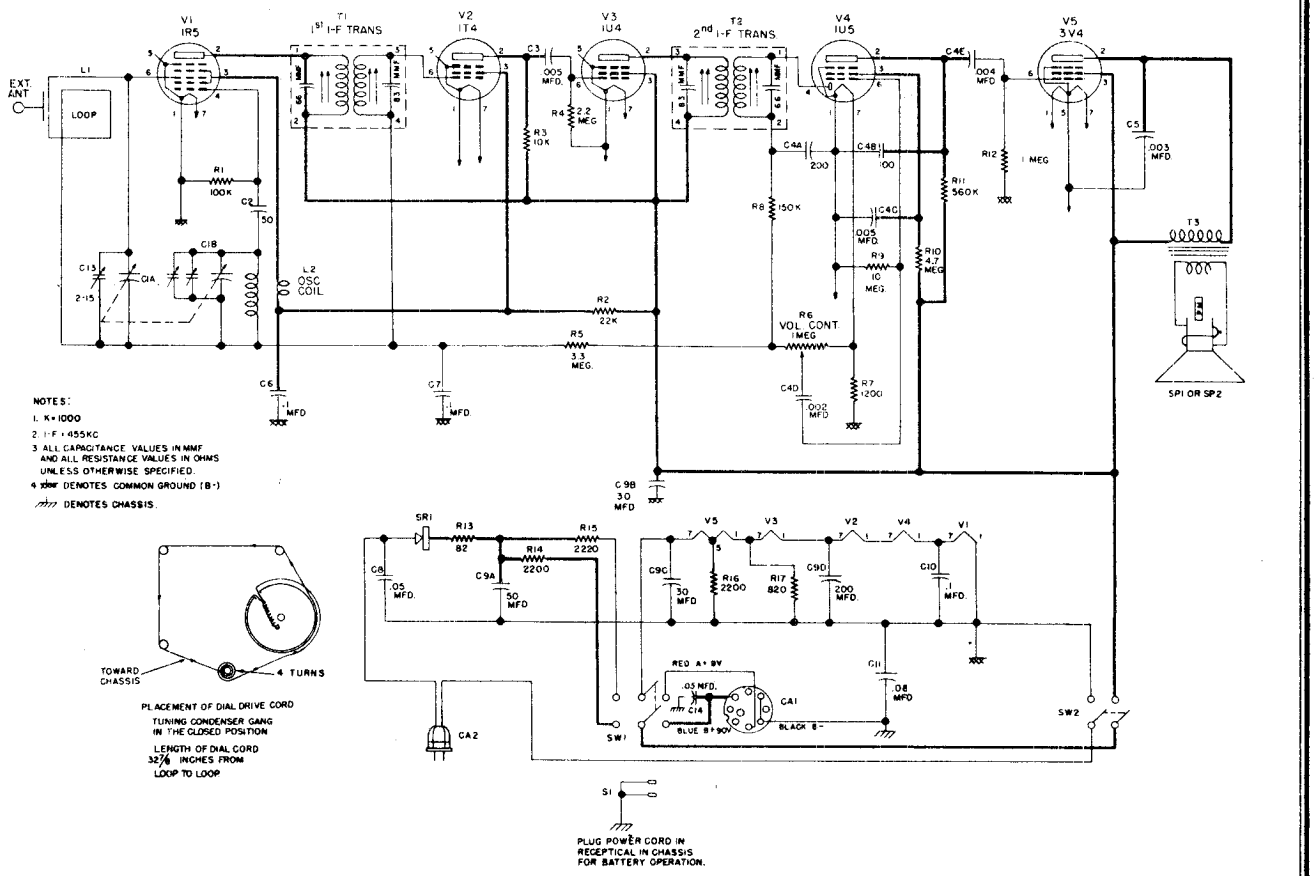
CHASSIS, TOP VIEW — MODEL 10-307M



SCHEMATIC DIAGRAM — MODEL 10-307M

©John F. Rider

ALIGNMENT PROCEDURE

ALIGNMENT SHOULD ALWAYS BE MADE ON BATTERY OPERATION.

1. Unsolder the two loop antenna leads from the rear of the tuning capacitor and remove the chassis from the cabinet.
2. Remove the chassis bottom cover and connect a 33,000 ohm resistor from the grid of the 1R5 converter tube to B— (pin 6 to pin 1 of V1 tube socket).
3. Connect the battery cable plug to the receptacle on the battery. Wrap the power cord around the metal cord supports and insert the prongs of the plug into the receptacle on the chassis.
4. Connect the output meter across the speaker voice coil.
5. Connect the high side of the signal generator through a 200 mmf. capacitor to the converter grid terminal (pin 6 of V1 tube socket). Connect the signal generator ground through a .05 mfd. capacitor to B— (pin 1 of V1 tube socket).
6. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment adjustment locations are shown on page 1, Chassis View — Model 10-307M

Alignment Sequence	Signal Generator Output			Position of Dial pointer or Var. Cond.	Adjust for Maximum Output	Remarks
	Frequency in KC	In Series with	To			
1	455	200 mmf.	V1 Grid	Open	A & B	See steps 2 & 5 of Alignment procedure
2	1620	200 mmf.	V1 Grid	Open	D	See notes 1 & 2 of Alignment notes
3	1400	Radiated to Loop		1400 kc	E	See notes 3 & 4 of Alignment notes

ALIGNMENT NOTES

1. After adjusting A and B, replace the chassis bottom.
2. Preset C to ¼ turn from its closed position before adjusting D.
3. Before adjusting E remove the 33,000 ohm resistor from pins 6 and 1 of the V1 tube socket. Replace the chassis in the cabinet and connect the antenna loop (see chassis top view). Make certain that the battery cable and the power cord are connected for battery operation (see step 3, Alignment Procedure), and the battery pack in place in the cabinet.
4. To obtain a radiated signal for this alignment, place the signal generator output lead near the loop antenna.

MODELS 58XTA,
58XTW, Rev.

DESCRIPTION

TYPE: Five-tube, two-band, superheterodyne.

FREQUENCY RANGE: American Broadcast Band, 540 to 1600 kc. (Selector Switch, Counter-clockwise or Left.)

Overseas Short-wave Band: 5.8 to 15 mc. (Selector Switch, Clockwise or Right.)

INTERMEDIATE FREQUENCY: 455 kc.

POWER SUPPLY: a.c.—d.c.

VOLTAGE RATING: 105-125 volts.

POWER CONSUMPTION: 35 watts nominal.

POWER OUTPUT: 1.5 watts minimum.

TUBE COMPLEMENT

Type	Function
12SA7	Mixer
14H7	I. F. Amplifier
14B6	Detector, AVC, 1st A. F. Amplifier
50A5	A. F. Power Output
35Y4	Rectifier

DIAL BULB: Type 47, 6.3 volts, .15 amp.

When using direct current it may be necessary to reverse the position of the power plug in the electric outlet for correct polarity.

Reversing the position of the power plug when alternating current is used may reduce power hum.

Under no circumtsances should a ground be connected to this receiver.

ALIGNMENT PROCEDURE

1. Turn the tuning condenser to the completely closed position against the stop and set the dial pointer to the reference line separating the medium and short wave scales.
2. Connect the output meter across the speaker voice coil.
3. The r.f. signal input from the signal generator should be connected to the external antenna lead. Connect the signal generator ground through a 0.1 mfd. condenser to B − (pin 3 on 14H7 tube socket).
4. Turn the volume control on full and adjust the signal generator output to produce approximately mid-scale deflection of the output meter, but maintain signal generator output as low as possible to prevent AVC action in the receiver.

ALIGNMENT CHART

Alignment adjustment locations are shown on page 2, Chassis, Rear View—Models 56XTA, 56XTW

Alignment Sequence	Signal Generator Output			Position of		Adjust for Maximum Output
	Frequency in kc.	In Series with	To	Band Switch	Tuning Dial	
1	455	200 mmf.	Ant.	Left	1,620	A & B
2	15,300	400 ohms	Ant.	Right	15,300	C
3	15,000	400 ohms	Ant.	Right	15,000	D
4	1,400	200 mmf.	Ant.	Left	1,400	E & F

NOTE: When aligning the short-wave oscillator trimmer (C), be sure that the circuit is aligned at the correct frequency and not at the image frequency which is 910 kilocycles lower as indicated by the receiver dial. To check: Tune in the generator frequency, then increase the generator output and tune in the image frequency. The image frequency should be weaker than the fundamental and audible 910 kilocycles lower on the receiver dial. If the image cannot be tuned in, the oscillator trimmer is adjusted to the wrong peak; i. e., the oscillator trimmer may be adjusted to the image or one of the harmonics instead of the fundamental frequency. The correct peak is the second one heard as the trimmer adjustment screw is opened from the completely closed position.

© John F. Rider

MODELS 58XTA, 58XTW, Rev.

CARACTERISTICAS

TIPO: Superheterodino, cinco tubos, dos bandas.

FRECUENCIAS: Banda de onda media 540 a 1600 KC (Interruptor de bandas hacia la izquierda)

Banda de onda corta: 5.8 a 15 mc. (Interruptor de bandas hacia la derecha)

FRECUENCIA INTERMEDIA: 455 KC.

FUENTE DE ALIMENTACION: Corriente alterna y directa.

VOLTAJE: 105-125 voltios.

CONSUMO: 35 watts.

POTENCIA DE SALIDA: 1.5 watts mínima.

DESCRIPCION DE TUBOS

Tipo	Funcion
12SA7	Mezclador
14H7	Amplificador de F. I.
14B6	Detector, C. A. V. y 1 er audio
50A5	Salida
35Y4	Rectificador

FOQUITO PILOTO: Tipo 47, 6.3 voltios .15 amp.

TABLA DE AJUSTES

Orden de Ajustes	SALIDA DEL OSCILADOR			Interruptor de Bandas	Sintonia Cuadrante	Ajuste a Maximum
	Frecuencia en KC	En serie con	A			
1	455	200 mmfd	Ant.	Izquierda	1,620	A y B
2	15,300	400 ohms	Ant	Derecha	15,300	C
3	15,000	400 ohms	Ant	Derecha	15,000	D
4	1,400	200 mmfd	Ant	Izquierda	1,400	E y F

Nota: Cuando ajuste el trimer (C) de onda corta asegúrese que el circuito sea ajustado a la frecuencia correcta y nó en la imagen que es 910 kilociclos más baja en el receptor. Para chequear: Sintonice la frecuencia del oscilador, aumente la salida del oscilador y sintonice la imagen en el receptor, la imagen debe ser más débil que la fundamental y estar 910 KC más abajo. Si no se puede sintonizar la imagen, el trimer del oscilador está mal ajustado, es decir el oscilador quizás esté ajustado a la imagen o algun harmónico de la frecuencia del oscilador. El pico correcto es el segundo que se escuche cuando se abre el tornillo de ajuste después de cerrarlo por completo.

Cuando se use este receptor en corriente directa será necesario ajustar la posición del enchufe del cordon a la polaridad correcta.

Cambiando la posicion del enchufe puede reducir zumbido de la corriente alterna.

Bajo ningun concepto no conecte tierra externa a este receptor.

AJUSTE

1. Cierre por completo el condensador variable y ponga la aguja de sintonía en la línea de referencia que separa las escalas de ondas cortas y media.
2. Concecte el metro de salida a través de la bobina móvil de la bocina.
3. Conecte la señal de RF del oscilador al alambre de antena exterior. Conecte la tierra del oscilador a través de un condensador de 0.1 mfd a B—(espiga 3 del 14H7).
4. Avance el control de volumen del receptor todo lo que dé y ajuste la salida del oscilador lo suficiente para producir una lectura en la mitad de la escala del metro de salida pero deberá mantenerla lo mas baja posible para evitar que el C. A. V. del receptor funcione.

These receivers will function from 105-125 volts, 40-60 cycles A.C. or D.C. power supply. A range of 535-1650 kilocycles and 4.75-17.2 megacycles, (17½-63M) is covered by these receivers.

To calibrate receiver connect the output of signal generator in series with a 200 MMFD fixed condenser to the flexible antenna lead attached to the loop antenna. Connect the low side of signal generator through a 1/10 mfd. condenser to receiver chassis. The wave band switch should be in the broadcast position. Adjust signal generator to 455 Kilocycles and adjust both I.F. transformers for maximum signal. Open the receiver variable condenser for minimum capacity. Turn the band switch to short wave position. Set signal generator at 17.2 Megacycles. Peak oscillator section of receiver condenser for maximum signal. Next set signal generator at 16 Megacycles. Tune in this signal. Adjust R.F. section of receiver variable condenser for maximum signal strength. The low frequency end of the dial is automatically adjusted by a fixed padder condenser. Next turn band switch to broadcast position. Rotate drive shaft until variable condenser is in minimum capacity position. Adjust signal generator to 1650 Kilocycles. Adjust the broadcast oscillator trimmer screw (C-1) until maximum signal from generator is heard. To adjust the low frequency, set the signal generator and receiver to 600 Kilocycles. Peak the broadcast padder (C-2) for maximum output. The variable condenser should be rocked during the operation. Keep the signal generator output as low as possible when making all of these measurements. It is extremely necessary in making the short wave adjustments, that the fundamental oscillator signal be tuned in and not the image frequency, which will fall below the fundamental.

REPLACEMENT PARTS

MODELS A504, A505

MODEL C-615

To calibrate receiver connect the output of signal generator in series with a 200 MMFD fixed condenser to the flexible antenna lead attached to the loop antenna. Connect the low side of signal generator through a 1/10 MFD. condenser to receiver chassis. The wave band switch should be in the broadcast position. Adjust signal generator to 455 Kilocycles and adjust both I. F. transformers for maximum signal. Open the receiver variable condenser for minimum capacity. Turn the band switch to short wave #1 position. Set signal generator at 24.2 Megacycles. Peak the short wave #1 oscillator trimmer screw (C5) for maximum signal. Next set signal generator at 23 Megacycles. Tune in this signal. Adjust short wave #1 R. F. trimmer screw (C2) for maximum signal strength. The low fequency end of the dial is automatically adjusted by a fixed padder condenser. Next turn band switch to short wave #2 position. Rotate drive shaft until variable condenser is in minimum capacity position. Adjust signal generator to 8 Megacycles. Adjust the short wave #2 oscillator trimmer screw (C4) until maximum signal from generator is heard. Next set signal generator at 7 Megacycles. Tune in this signal. Adjust short wave #2 R. F. trimmer screw (C1) for maximum signal strength. The low frequency end of the dial is automatically adjusted by a fixed padder condenser. Next turn band switch to broadcast position. Adjust signal generator to 1500 Kilocycles. Tune in this signal. Adjust the broadcast oscillator trimmer screw (C3) until maximum signal from generator is heard. To adjust the low frequency, set the signal generator and receiver to 600 Kilocycles. Peak the broadcast padder (C7) for maximum output. The variable condenser should be rocked during the operation. Keep the signal generator output as low as possible when making all of these measurements. It is extremely necessary in making the short wave adjustments, that the fundamental oscillator signal be tuned in and not the image frequency, which will fall below the fundamental.

Cabinet Back 4095
Cabinet 4093
Knob 4055A-6
Concentric Knob 4096

The model C-615 is a three band superheterodyne receiver, having one broadcast range and two short wave ranges. This receiver features Spread-A-Matic Tuning, a loop-tenna for broadcast, and automatic volume control. It has been designed to operate at 105-125 volts, 50-60 cycles A.C. or at 210-250 volts, 50-60 cycles A.C. as specified on tag attached to line cord Instructions for tap changing are given on the reverse side.

B. C. Band	525-1680 Kilocycles	570-178 meters
S. W. 2 Band	2.5 M.C. to 8.0 M.C.	120 to 37.5 meters
S. W. 1 Band	7.5 M.C. to 24.2 M.C.	40 to 12.4 meters

INSTALLATION: Make certain that all tubes are in place and pressed down in their sockets. A label showing the location of each tube will be found underneath the cabinet. A loop-tenna is incorporated which makes the use of an antenna unnecessary, in most localities, for broadcast reception. If it is found that additional pick-up is desired on the standard band, an antenna may be connected to the red lead extending from the rear of the chassis, and the black lead connected to an external ground. On short wave reception an antenna and external ground should be used.

VOLUME CONTROL AND POWER SWITCH: The second knob from the left is the power switch and volume control. When the control is in the extreme counterclockwise position the power is "off". From this position, a slight clockwise rotation will turn the power "on", and by further rotation in this direction, volume may be increased to any degree until the full output of the receiver is obtained.

TUNING CONTROL: The knob on the right is the tuning control knob which operates the bottom pointer and tuning condenser through a reduction drive to insure ease and accuracy in the selection of stations.

SPREAD-A-MATIC TUNING CONTROL: There are two concentric knobs on the extreme left. The large knob operates the SPREAD-A-MATIC tuning. This is a special feature of this receiver, providing greater ease of tuning and better separation of stations on all three wave bands. To operate, turn the knob until the top pointer is set to "0", in the center of the SPREAD-A-MATIC scale. Tune in the desired station with the Tuning Control. By turning the SPREAD-A-MATIC control knob clockwise and counterclockwise the top pointer will move to the left and right of "0", and the station can be tuned in very accurately. When it is desired to change the station the SPREAD-A-MATIC pointer should first be set back to "0".

WAVE BAND SWITCH: The second knob from the right of the receiver is the wave band switch control. This knob has three positions. When the knob is in the extreme counterclockwise position, standard broadcast stations may be tuned in. When the knob is in the extreme clockwise position, short wave band #1 may be tuned in. The intermediate position is for tuning in short wave band #2.

TONE CONTROL SWITCH: The small concentric knob on the extreme left has two positions which allows the selection of two degrees of tone response.

PHONOGRAPH OPERATION: A terminal board marked "HIGH-LOW" is provided in the back of the chassis. For phonograph operation connect the Pick-Up to the terminals. Be sure the Tuning Control is off a station. If loud hum is heard when touching the Pick-Up arm reverse the leads to the terminals.

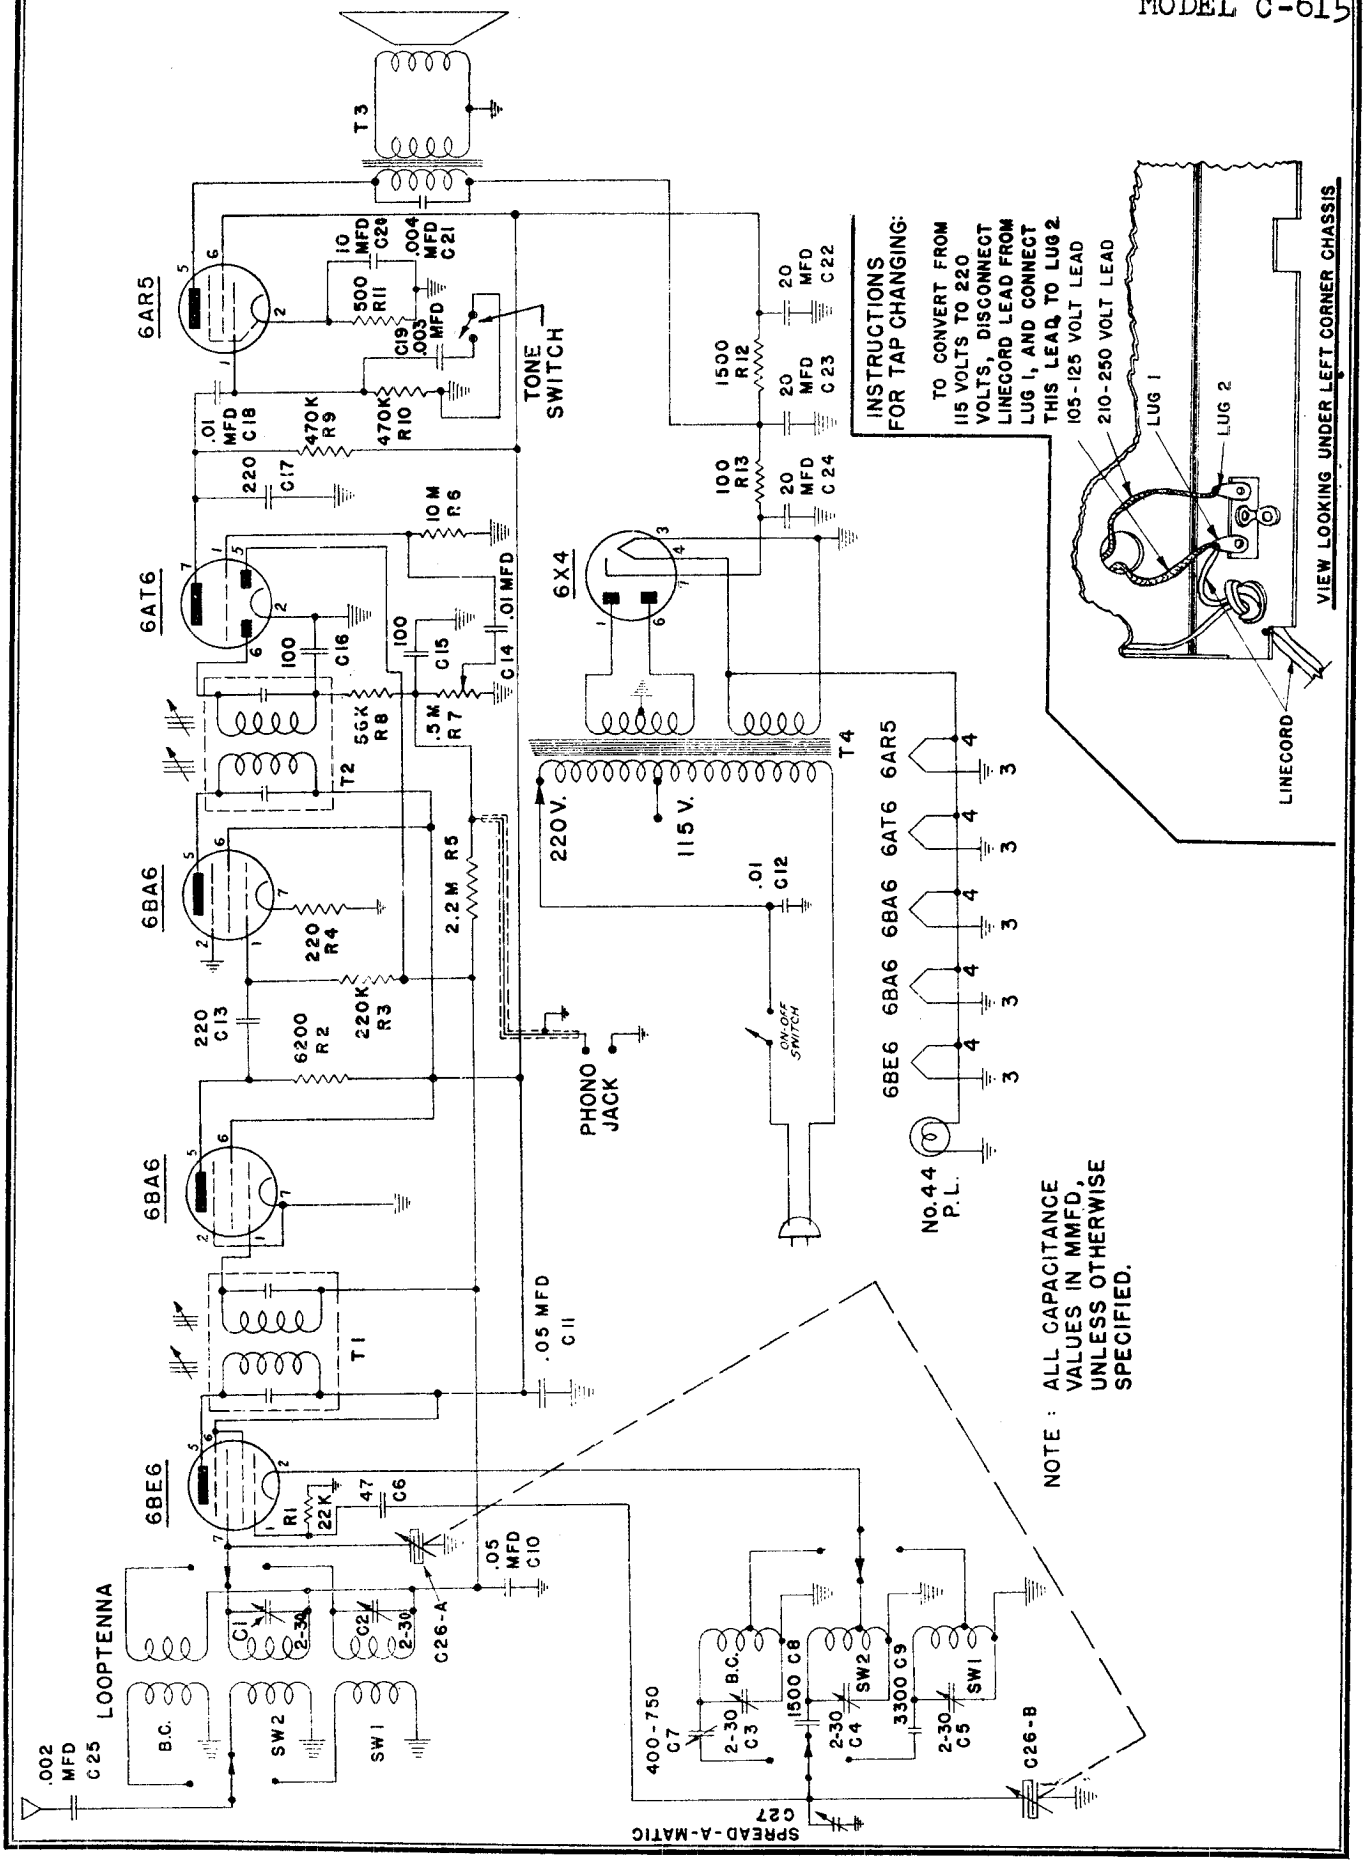
MODEL C-615



©John F. Rider

MODEL C-800

The DeWald Model **C-800** is an AM-FM receiver. This receiver may be operated on either AC or DC, 105-125 volts, 50-60 cycles.

FM . . . . 88 to 108 MC.
AM . . . . 540 to 1700 KC.

Antenna Connections:

Your DeWald C-800 is a sensitive receiver. It is equipped with built-in AM and FM antennae so that in primary listening areas an outside antenna is not necessary. WHEN LISTENING TO FM BY USING THE BUILT-IN ANTENNA, KEEP THE ELECTRIC LINE CORD EXTENDED TO ITS FULL LENGTH.

For weak or distant stations there are provisions made in the rear for antenna connections. A terminal strip with two screw connections for the lead-in wires from the FM antenna, also a wire coming out the back of the receiver for an external AM antenna.

When using the built-in antenna on FM, the lug coming out between the two screw connections on the terminal strip in the rear, must be connected to the screw connection marked "ANT." When using an external FM antenna disconnect this wire and connect external antenna lead-in wires to the two screw connections.

Station Selector:

The knob on the extreme right hand side of the cabinet operates the tuning condenser on both AM and FM and simultaneously moves the indicating pointer. Ease and accuracy in tuning is made possible due to a reduction drive.

Band Switch:

The second knob from the right is the AM-FM band switch. This is a two position switch. When the switch is in the counterclockwise position, AM (Standard Broadcast) stations may be tuned in. When the switch is in the clockwise position, FM (Frequency Modulation) stations may be tuned in.

Volume Control and Power Switch:

The third knob from the right is the volume control and power switch. When the control is in the extreme counterclockwise position the power is "OFF." From this position, a slight clockwise rotation will turn the power "ON." By further rotation in this direction volume may be increased to any degree until the full output of the receiver is obtained.

Tone Switch:

The fourth knob from the right is the tone switch. For normal operation the switch should be clockwise. For increased bass response turn switch fully counterclockwise.

Notes:

Since this receiver has a loop-tenna on AM which has a directional effect, it may be necessary at times to turn the receiver for best reception. This set will operate properly only after the tubes are sufficiently heated. This may take two minutes after the power switch is turned "ON." If the receiver is being operated on DC (Direct Current) and no signals are heard after two minutes, reverse the line cord plug in the power outlet. Should noticeable hum be detected when operating on AC (Alternating Current), reverse the line cord plug in the power outlet.

Servicing of the DeWald Model C-800
(For Use of Radio Technician):

Should your DeWald Model C-800 become inoperative for any reason, we suggest you contact your local DeWald Radio and Television Dealer for servicing. The following information is for the use by the radio serviceman.

Alignment of the receiver will, in most cases, be unnecessary unless an RF or IF transformer is replaced or the adjustment has been tampered with. The IF slugs are slotted for a small size fiber screwdriver. Do not put excessive pressure on the aligning tool or the threads in the coil-form will be stripped and adjustments will be impossible.

IF Alignment:

Set bandswitch to AM position. Connect the signal generator, modulated at 400 cycles, through a 0.01 Mfd condenser to the grid of the 12AT7 converter tube. Connect the low side of the generator through a 0.1 Mfd condenser to the receiver chassis. Adjust the signal generator to 455 KC. Tune primary and secondary slugs of T3 & T5, AM-IF Transformers, for maximum output.

For FM alignment set bandswitch to FM position and leave generator connected to the grid of the 12AT7 converter tube. Adjust generator to 10.7 MC. Connect 20,000 ohm per volt or VTVM meter as in note "1" of schematic diagram. Tune primary of T1, bottom slug, and both primary and secondary of T2 & T4 for maximum indication on meter. To align secondary of Ratio Detector Transformer connect meter as in note "2" of schematic diagram. Tune top slug through positive and negative indication and then slowly return until meter reads zero. This is in the center of the "S" curve.

RF Alignment:

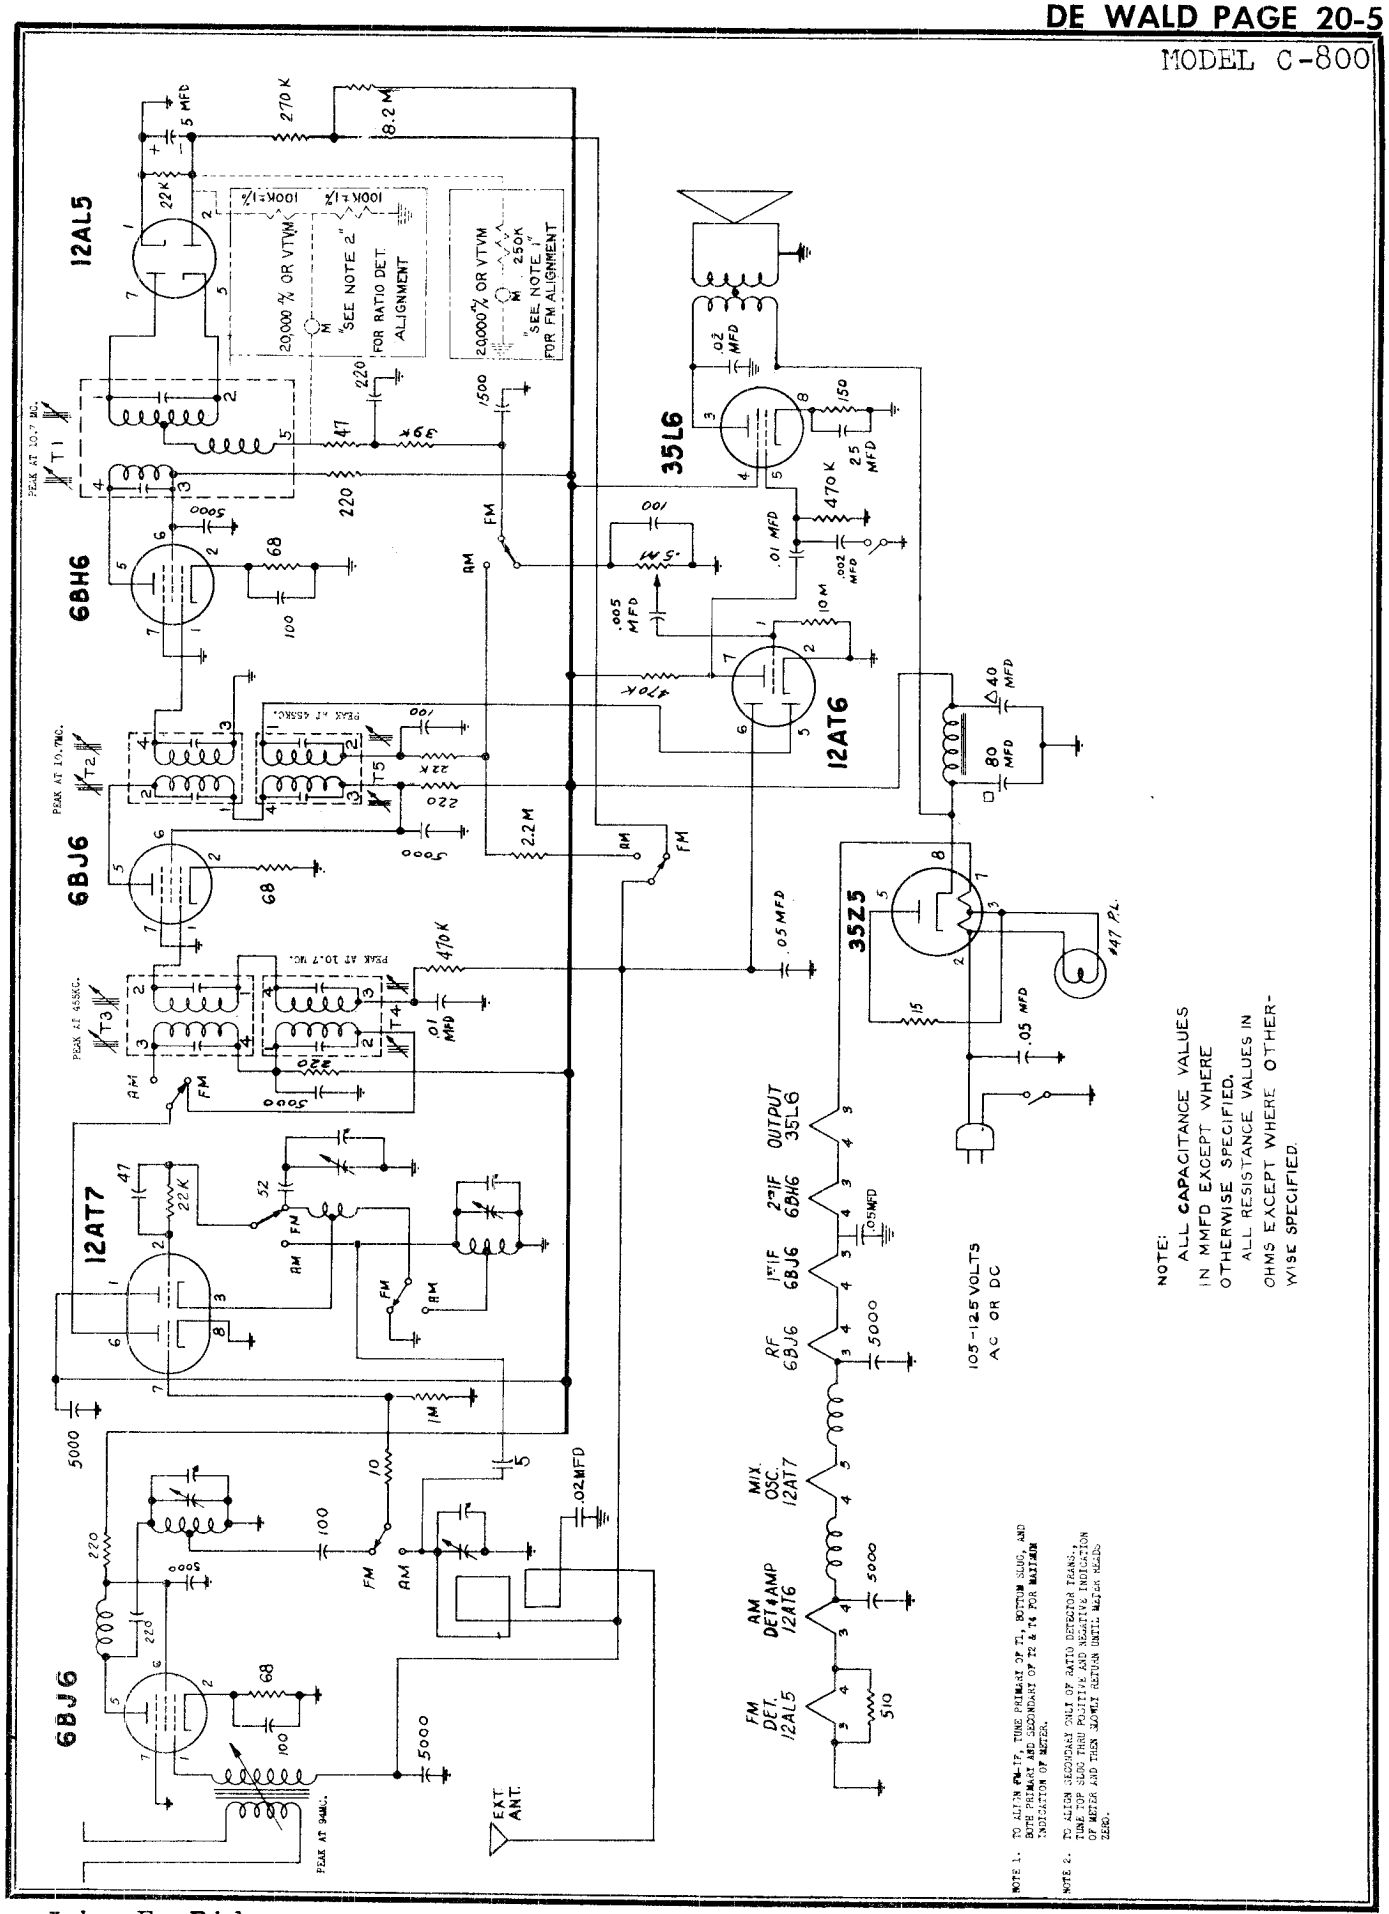
Set bandswitch to AM position. Connect signal generator, modulated at 400 cycles, to external antenna lead and to ground through a 0.1 Mfd condenser and adjust to 1700 KC. Set dial pointer to 1700 KC and tune signal for maximum output with oscillator trimmer. Next set generator to 1500 KC and tune in this signal on the receiver. Then adjust RF trimmer for maximum output.

Set bandswitch to FM position. Connect in series with each generator lead a carbon 150 ohm resistor and connect to rear antenna terminal board. Adjust generator and dial pointer to 108 MC. Peak oscillator trimmer for maximum signal output. Next set generator to 105 MC and tune in this signal on receiver. Then peak RF trimmer for maximum output. No adjustment is necessary at the low end because a special compensated fixed padder is used. Set the generator to 94 MC and tune the FM antenna coil for maximum.

In all the IF and RF adjustments it is important to keep the signal generator output as low as possible. It is extremely necessary in making the RF adjustments, that the fundamental oscillator signal be tuned in and not the image frequency. This can be checked by the use of a calibrated wavemeter.

©John F. Rider

MODEL C-800



NOTE:
ALL CAPACITANCE VALUES IN MMFD EXCEPT WHERE OTHERWISE SPECIFIED.
ALL RESISTANCE VALUES IN OHMS EXCEPT WHERE OTHERWISE SPECIFIED.

NOTE 1. TO ALIGN FM-IF, TUNE PRIMARY OF T1, BOTTOM SLUG, AND BOTH PRIMARY AND SECONDARY OF T2 & T4 FOR MAXIMUM INDICATION OF METER.

NOTE 2. TO ALIGN SECONDARY UNIT OF RATIO DETECTOR TRANS.; TUNE TOP SLUG THEN POSITIVE AND NEGATIVE INDICATION OF METER AND THEN SLOWLY RETURN UNTIL METER READS ZERO.

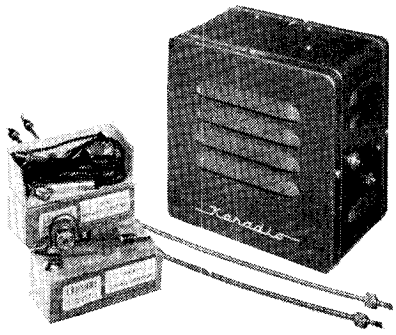
INSTALLATION AND OPERATING INSTRUCTIONS



MOUNTING ●

The chassis contains the complete radio, power supply and speaker. This unit may be mounted in any convenient location on the bulkhead of the car. If possible it should be mounted on the left side or close to the center. This makes for an easier installation. This installation is made by drilling only one 5/16 inch hole in the bulkhead. Care must be taken to see that the mounting bolts on this unit as well as all others, such as the antenna and generator condenser, form a good ground connection. This can be accomplished by scraping the paint from the spot under the mounting nut and washer.

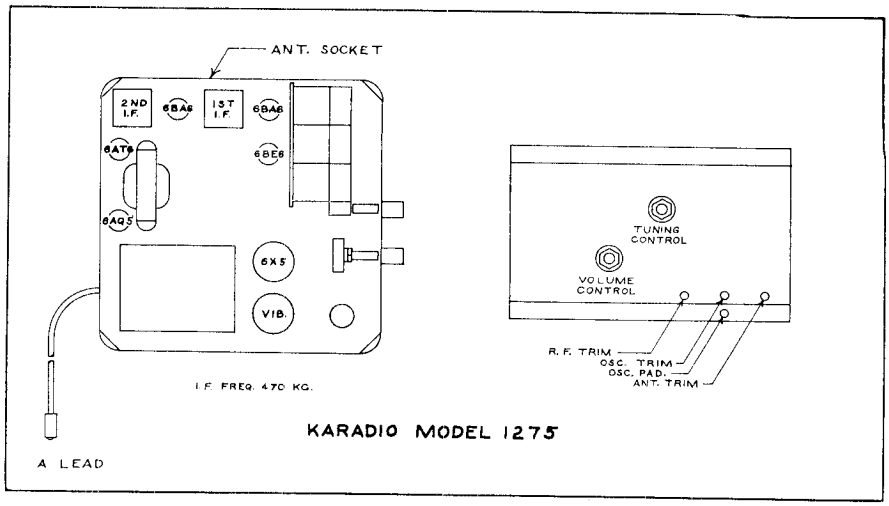


FIGURE 1

Install flexible cables in the proper place (see figure 1). The other end of cables go to the controls 716-T1 and 700-V2. These are installed in the panel kit (see instructions furnished with panel kit). The "A" lead of the radio connects to power socket on control 700-V2.

Antenna lead is plugged into the antenna socket (see figure 1).

After installation, tune in a weak station around 1400 K.C. and adjust antenna trimmer for maximum volume. DO NOT ADJUST OTHER TRIMMERS.

©John F. Rider

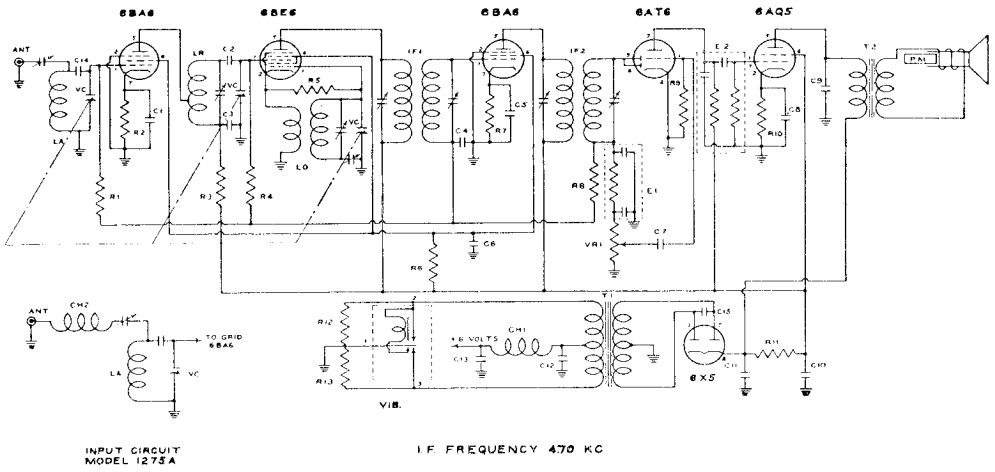

FIGURE 2

ELIMINATION OF INTERFERENCE —

Remove the coil-to-distributor high-tension lead from the distributor. Cut the lead two inches from the end, and screw the distributor resistor onto the coil lead. Then screw the short length into the resistor, and plug the cable into the distributor cap.

One noise-filter condenser is furnished. Condenser must be connected to the output terminal of the generator (never to the field terminal). The generator-condenser bracket should be fastened to the generator housing, under the screw that holds the field.
In some particularly stubborn cases of motor interference, one or more of the following procedures may be necessary:

A condenser can often be used to advantage on the electrically operated oil gauge or gas gauge. Connect the condenser lead to the terminal of the gauge, and bolt the condenser case securely to the frame or some other grounded part of the car.

Bonding the steering column to the fire wall with a short braid may also be effective. Clean the paint from the steering column at the fire wall where the column enters the motor compartment, and solder on a short piece of braid. Ground the end of the braid to the fire wall.

In some cases it may be necessary to ground the tubes and rods coming through the fire wall in order to reduce the interference. Clean them with emery cloth and spot-solder the braid. fastening the end under a convenient screw.

In some cases it may be necessary to connect an additional condenser to the ammeter or to the ignition switch.

It may be necessary to use a condenser on the voltage regulator. The condenser case should be mounted under one of the voltage-regulator mounting screws, or at some other convenient location, and the lead connected to the battery terminal of the voltage regulator.

Interference from electric clocks can be eliminated by connecting a condenser to the ammeter terminal. The case of the condenser must be securely grounded.

If tire-static interference is noted in a particular installation, static collector springs should be obtained and installed in the front wheels of the car.

MODEL 575, Ch. 120068A, 120068B

DESCRIPTION

TYPE: Three way (battery, a.c., d.c.) portable superheterodyne.

FREQUENCY RANGE: 540-1620 KC.

TYPE OF TUBES:
1—1U4 r-f amplifier
1—1R5, pentagrid converter
1—1U4, i-f amplifier
1—1U5, detector, a.v.c., a-f amplifier
1—3V4, power output
1—117Z3, rectifier

POWER SUPPLY: Battery powerpack, or a.c., or d.c.

VOLTAGE RATING:
Line operation—105-125 volts, a.c. or d.c.
Battery operation—9 volts "A" supply
90 volts "B" supply

POWER CONSUMPTION: Line operation 20 watts

CURRENT CONSUMPTION:
"A" battery—.055 amp.
"B" battery—.013 amp.
117 volts a.c.—.170 amp.

GENERAL NOTES

1. Line Operation: Open the rear cover which is held closed by the catch studs. Remove the line cord plug from its receptacle at the right side of the chassis (looking from the rear). Remove the line cord and insert the plug into a suitable outlet. When the power supply is d.c. and the receiver remains inoperative, remove the plug, turn it half-way around and reinsert in the outlet to obtain proper polarity.
2. Battery Operation: Remove the line plug from the outlet and insert in the receptacle at the right side of the chassis. The receiver will not operate from batteries if the plug is out of the chassis receptacle. Coil the loose portion of the line cord and store it carefully in the compartment formed by the insulating paper.
3. Battery Complement: Replace the power pack unit with Eveready No. 753 or Rayovac No. AB994 batteries. These units supply both "A" and "B" voltages for battery operation.
4. The color coding of the battery cable is as follows:
   Red— B+, 90 volts Yellow— A+, 9 volts
   White— B— Black— A—
5. If replacements are made in the r-f section of the circuit, carefully realign the receiver.
6. The receiver has a self contained antenna and normally does not require an additional antenna connection. For installations in a location where reception is weak, connect an outside antenna to the colored lead connected to the loop at the left side of the cabinet (looking from the rear). Do not use a ground connection.
7. The self-contained loop antenna has directional properties. After a station is tuned in, it is important that the set be rotated through a quarter turn to obtain the position which results in the greatest volume.

ALIGNMENT PROCEDURE

1. Use battery power when available. When a.c. power is used, connect the line cord through an isolation transformer if available. Otherwise connect a 0.1 mfd. condenser in series with the low side of the signal generator and B—.
2. Set the volume control at maximum. The output of the signal generator should be no higher than that necessary to obtain an output reading. Attenuate the signal input as alignment proceeds. Use an insulated alignment tool.
3. Maintain the loop in the same position relative to the chassis as when the receiver is in the cabinet.

STEP	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	0.1 mfd.	High side to grid (pin 6) of V2 (1R5). Low side to chassis.	455 KC.	Variable condenser fully open.	Across voice coil	T-2, T-1 (Chassis 120101A) T-3, T-2 (Chassis 120101B)	Adjust for maximum output. If a.c. is used, without an isolation transformer, reduce dummy antenna to 200 mmf. to reduce hum modulation.
2	0.1 mfd.	High side to grid (pin 6) of V1 (1U4). Low side to chassis.	455 KC.	"	"	C-7 (Chassis 120101A) or T-1 (Chassis 120101B)	Adjust for minimum output.
3	200 mmf.	Form loop of several turns and radiate signal into receiver.	1620 KC.	"	"	Trimmer cond. C-4. (Osc.)	Adjust for maximum output.
4	200 mmf.	"	1400 KC.	Tune for maximum output.	"	Trimmer cond. C-3. (Ant.)	Adjust for maximum output.

CONDITIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Measurements made for 120 volt a.c. operation.
2. Voltages shown are + d.c. unless otherwise indicated.
3. All measurements made with voltohmyst or equivalent.
4. Upper values are voltage, lower values resistance on diagram. NC=no connection; K=kilohms; Meg.=megohms; INF.=infinity.
5. Measurements made on Chassis 120068B.
6. Normal tolerance on components makes possible a variation of ±15% from readings shown.

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltage readings are in d.c. volts and resistance readings in ohms unless otherwise specified.
2. All measurements made with voltohmyst.
3. Socket connections are shown as bottom views.
4. Measured values are from socket pin to common negative, unless otherwise specified.
5. Line voltage maintained at 117 volts for voltage readings.
6. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
7. Volume control at maximum with no signal applied, for voltage measurements.

VOLTAGE READINGS

NC = no connection; K = kilohm; Meg. = megohm.
* Readings taken to pin 8 of V5.

ALIGNMENT PROCEDURE

1. Use isolation transformer if available. If not, connect a 0.1 mfd. condenser in series with low side of signal generator and chassis.
2. Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading.
3. Use an insulated alignment screwdriver for adjusting.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	METER OUTPUT	ADJUST	REMARKS
1	0.1 mfd.	High side to pin 8 (grid) of 12SA7GT (V1). Low side to chassis.	455 kc	Variable condenser fully open.	Across voice coil.	T2, T1,	Adjust for maximum output. If isolation transformer is not used, reduce dummy antenna to 0.001 mfd. to reduce hum modulation.
2	200 mmfd.	High side to external antenna lead. Low side to chassis.	1620 kc	Variable condenser fully open.	Across voice coil.	Trimmer condenser on oscillator section C9B.	Adjust for maximum output.
3	200 mmfd.	High side to external antenna lead. Low side to chassis.	1450 kc	Tune for maximum output.	Across voice coil.	Trimmer condenser on antenna section C9A.	Adjust for maximum output.

DESCRIPTION

TYPE: Single band (AM) superheterodyne

FREQUENCY RANGE: 540-1620 KC.

TYPES OF TUBES:

1—12SA7GT converter
1—12SK7GT i-f amplifier
1—12SQ7GT detector, a.v.c., a-f amplifier
1—50L6GT power output
1—35Z5GT rectifier

NOTE: Metal tubes, types 12SA7, 12SK7, and 12SQ7 may be used on same chassis.

POWER SUPPLY: A.c. or d.c.

VOLTAGE RATING: 105-125 volts

POWER CONSUMPTION: 30 watts

CURRENT DRAIN: 0.24 amp. at 117 volts a.c.

MODELS 587, Ch. 120033A, 120033B; 610, 616, Ch. 120100A, 120100B

DESCRIPTION

TYPE: Single-band (AM) superheterodyne.

FREQUENCY RANGE: 540-1620 kc.

TYPE OF TUBES:

1—12SA7GT, converter

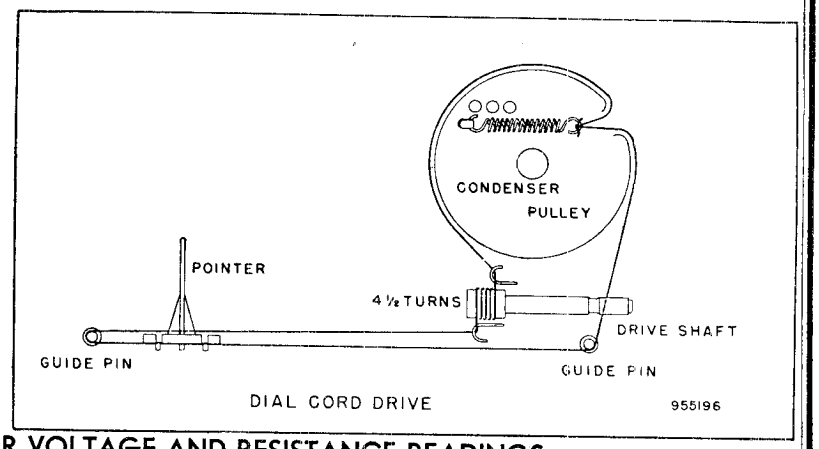
1—12SK7GT i-f amplifier

1—12SQ7GT, detector, a.v.c., a-f amplifier

1—50L6GT, power output

1—35Z5GT, rectifier

POWER SUPPLY: A.c. or d.c.
VOLTAGE RATING: 105-125 volts.
POWER CONSUMPTION: 30 watts.
CURRENT DRAIN: 0.24 amp. at 117 volts a.c.



INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltage readings are d.c. volts and resistance readings in ohms, unless otherwise specified.
2. All measurements made with voltohmyst.
3. Socket connections are shown as bottom views.
4. Measured values are from socket pin to common negative, unless otherwise noted.
5. Line voltage maintained at 117 volts a.c. for voltage readings.
6. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
7. Volume control at maximum with no signal applied, for voltage measurements.

K=kilohms; Meg.=megohms; NC=no connection; * Measured to pin 8 of V5, 35Z5GT.

ALIGNMENT INSTRUCTIONS

1. To position pointer, turn variable condenser fully closed and set pointer to reference mark at low frequency end of dial backplate.
2. Use isolation transformer if available. If not, connect a 0.1 mfd. condenser in series with low side of signal generator and chassis.
3. Volume control should be at maximum position; output of signal generator should be no higher than necessary to obtain an output reading.
4. Use an insulated alignment tool for all adjustments.

ALIGNMENT PROCEDURE

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	METER OUTPUT	ADJUST	REMARKS
1	0.1 mfd.	High side to grid (pin 8) of 12SA7GT(V1). Low side to chassis.	455 kc.	Variable condenser fully open.	Across voice coil.	Second i-f trans. T2 and first i-f trans. T1.	Adjust for maximum output. If isolation transformer is not used, reduce dummy antenna to .001 mfd. to reduce hum modulation.
2	200 mmfd.	High side to external antenna lead. Low side to chassis.	1620 kc.	Variable condenser fully open.	Across voice coil.	Oscillator trimmer on C2.	Adjust for maximum output.
3	200 mmfd.	High side to external antenna lead. Low side to chassis.	1450 kc.	Tune for maximum output.	Across voice coil.	Antenna trimmer on C1.	Adjust for maximum output.

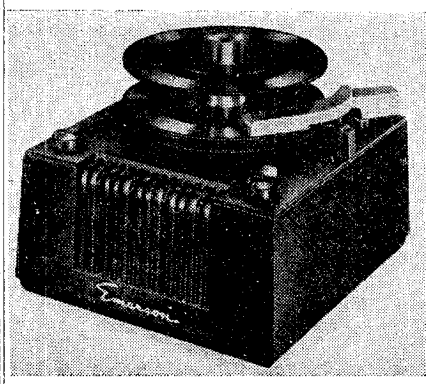
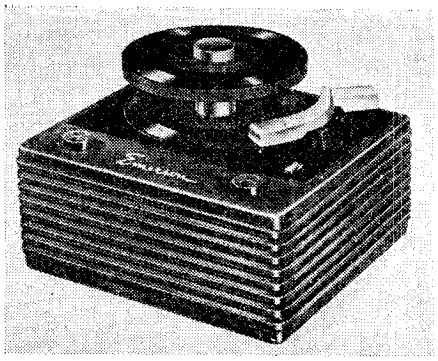
MODELS 590, 623, Ch. 120101A, 120101B; 635, Ch. 120108B



MODEL 590



MODEL 623

MODEL 635

GENERAL NOTES

1. All models are equipped with an automatic record changer that plays up to ten 7-inch, 45 rpm records only. A permanent type needle is supplied.
2. If replacements are made or the wiring disturbed in the r-f section of Model 635, the receiver should be carefully realigned.
3. Model 635 has a self-contained antenna and does not require an additional antenna. For permanent installations, however, if it desired to improve reception of weak stations, an additional outdoor antenna may be connected to the colored lead at the rear of the cabinet.
4. The self-contained loop antenna has directional properties. It is important, therefore, once a station is tuned in, that the cabinet be rotated back and forth through a quarter-turn and left at that position where maximum volume is obtained.

DESCRIPTION

TYPE: Models 590, 623—Automatic phonograph, 45 rpm. Model 635—Single band superheterodyne with automatic record changer, 45 rpm.

FREQUENCY RANGE: 540-1620 kc.

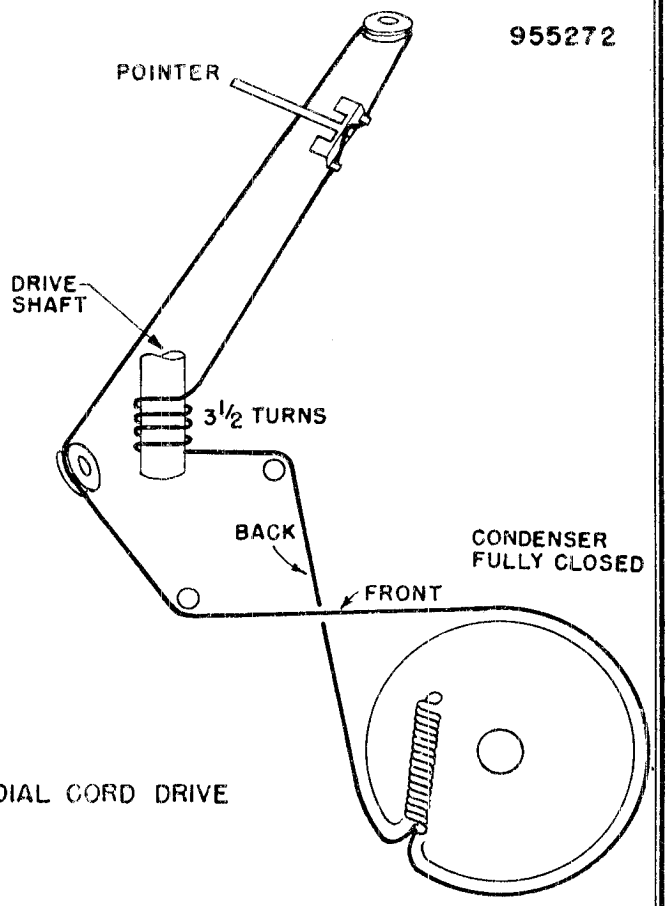
TYPE OF TUBES:

Models 590, 623—Chassis 120101A or B.
1—12AV6, audio amplifier
1—50C5, audio output
1—35W4, rectifier

Model 635—Chassis 120108B
1—12BE6, converter
1—12BA6, i-f amplifier
1—12AT6, detector, a.v.c., a-f amplifier
1—50B5, power output
1—35W4, rectifier

POWER SUPPLY: 105-125 volts, 60 cycles a.c. only

POWER CONSUMPTION—50 watts.



Dial Cord Stringing, Model 635

©John F. Rider

MODELS 590, 623, Ch. 120101A, 120101B; 635, Ch. 120108B

CONDITIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltages indicated are positive d.c., resistances are in ohms, unless otherwise indicated.
2. Measurements made with voltohmyst or equivalent.
3. Line voltage maintained at 120 volts a.c. for voltage measurements.
4. Socket connections are shown as bottom views, with measurements from pin to common negative.
5. Volume control at maximum; radio-phono switch in radio position; no signal applied for Model 635 measurements.
6. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.
7. On the diagrams, upper values are voltage; lower values are resistance. NC denotes no connection, K is kilohms, MEG is megohms, INF. is infinity. Resistances marked * are measured to pin 7 of rectifier (B+).

ALIGNMENT INSTRUCTIONS — MODEL 635

1. To position pointer, turn variable condenser fully closed and set pointer to reference mark at low-frequency end of dial backplate.
2. Use isolation transformer if available. If not, connect a .1 mfd. condenser in series with low side of signal generator and B—.
3. Volume control should be at maximum position; radio-phono switch in radio position. Output of signal generator should be no higher than necessary to obtain an output reading. Use an insulated screw driver for adjusting.

STEP	DUMMY ANTENNA	SIGNAL GENERATOR OUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	.1 mfd.	High side to grid (pin 7) of V1 (12BE6). Low side to chassis.	455 KC	Variable condenser fully open.	Across voice coil.	T2, T1	Adjust for maximum output. If isolation transformer is not used, reduce dummy ant. to .001 mfd. to reduce hum modulation.
2	200 mmf.	Form loop of several turns and radiate signal into receiver.	1620 KC	"	Across voice coil.	Trimmer C-4. (Osc.)	Adjust for maximum output.
3	200 mmf.	"	1400 KC	Tune for maximum output.	Across voice coil.	Trimmer C-3. (Ant.)	Adjust for maximum output.

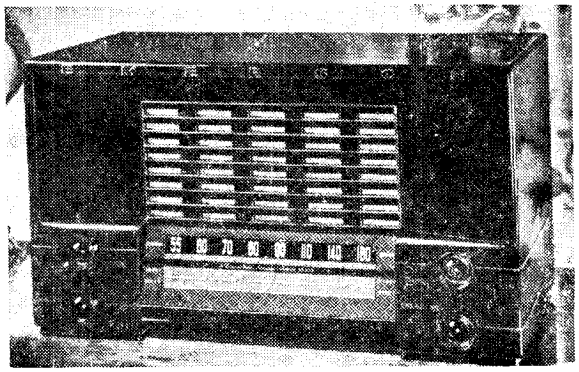
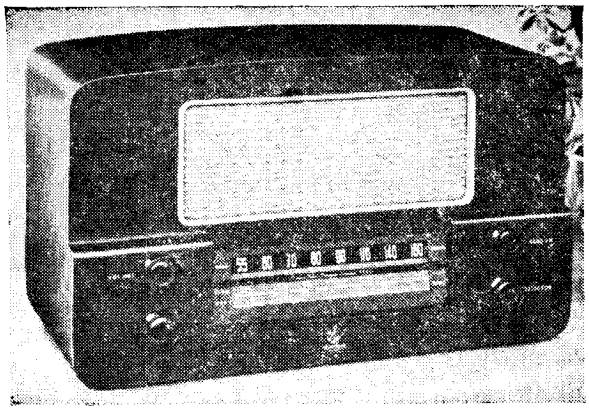
MODELS 597, 607, Ch. 120073B, 120074A



MODEL 597



MODEL 607

DESCRIPTION

TYPE: Three band superheterodyne

FREQUENCY RANGE:

Broadcast— 535-1620 kc.
Short wave 1— 3.2-7.5 mc.
Short wave 2— 9.0-22.0 mc.

TYPE OF TUBES:

1—6SB7Y, converter
1—6SG7, i-f amplifier
1—6SQ7, detector, a.v.c., a-f amplifier
1—6K6GT/G, power output
1—5Y3GT, rectifier

POWER SUPPLY: 50-60 cycles a.c.

VOLTAGE RATING:

Chassis 120073B—105-125 volts
Chassis 120074A—105-125 volts or 210-240 volts
POWER CONSUMPTION: 82 watts

CURRENT DRAIN: 0.7 amps. at 117 volts

GENERAL NOTES

1. If replacements are made or the wiring disturbed in the r-f section of the circuit, the receiver should be carefully realigned.
2. A self-contained loop antenna is provided for broadcast band reception. For maximum reception, rotate the receiver through a quarter of a circle after tuning in desired station, and leave at position resulting in greatest volume.
3. An internal power line antenna is provided for relatively strong short wave signals. The line cord must be completely uncoiled for effective operation of this antenna.
4. An external antenna is recommended for maximum short wave reception. To connect the external antenna, first disconnect the lead from the screw terminal on the loop marked "ANT." Connect the external antenna lead in its place.
5. To operate the set on the external antenna for broadcast band reception as well, loosen the terminal screw fastening the connecting link to "LOOP" on the broadcast antenna switch. Turn the link to "EXT. ANT." position and tighten the terminal screw to fasten the link in place.
6. A receptacle is provided at the rear of the chassis for connection of a phono pickup to the receiver. The range switch must be in the "PHONO" position for operation with a phonograph.
7. The band spread tuning control, located at the lower left section of the front panel, is effective only on short wave band 2.
8. Chassis 120073B operates on 105-125 volts, 50-60 cycles a.c. only; chassis 120074A is provided with a voltage changeover switch located on the power transformer at the rear of the set and may operate on 105-125 volts or 210-240 volts, 50-60 cycles a.c.

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltage readings are in d.c. volts and resistance readings in ohms, unless otherwise specified.
2. Measurements made with voltohmyst.
3. Socket connections are shown as bottom views. Values are measured from socket pin to common negative, unless otherwise noted.
4. Line voltage maintained at 117 volts a.c. for voltage readings.
5. Nominal tolerance on component values makes possible a variation of ± 15% in readings.
6. Volume control at maximum, with no signal applied and bandswitch in broadcast position, for voltage measurements.

VOLTAGE READINGS

ALIGNMENT INSTRUCTIONS

1. To position pointer, turn variable condenser fully closed and set pointer to reference mark on dial backplate at the low freqnency end of the dial.
2. Volume control should be set at maximum position. The output of the signal generator should be no higher than necessary to obtain an output reading. Attenuate the signal input as alignment proceds. Use an insulated alignment tool for all adjustments.
3. Use isolation transformer if available; otherwise connect a .1 mfd. condenser in series with low side of signal generator to chassis.
4. Connect output meter across voice coil for all alignment steps.
5. Refer to illustration on page 3 for location of alignment points.

ALIGNMENT PROCEDURE

STEP	SIGNAL GENERATOR COUPLING	SIG. GEN. FREQ.	BANDSWITCH POSITION	DIAL SETTING	ADJUST	PROCEDURE
1	High side through .1 mfd., dummy antenna to grid (Pin 8) of 6SB7Y (V1). Low side to chassis.	455KC.	Broadcast.	Tuning condenser fully open.	A1, A2 (Trans. T1), and A3, A4 (Trans. T2).	Adjust for maximum output. Reduce dummy antenna to 200 mmf., if isolation trans. is not used.
2	High side through 200 mmf. dummy antenna to "ANT." term. on antenna terminal strip. Low side to chassis.	455KC.	Broadcast.	Tuning condenser fully open.	A5 (Trimmer C1, on wave trap).	Adjust for minimum output.
3	" Antenna switch (SW3) in "EXT. ANT." position.	1450KC.	Broadcast.	Set pointer to 1450 kc. on dial.	A7 (Trimmer C14), A9 (Trimmer C3).	Adjust for maximum output (oscillator and ant. trimmers).
4	"	600KC.	Broadcast.	Set pointer to 600 kc. on dial.	A6 (Padder C15).	Adjust for maximum output (oscillator padder).
5	"	1450KC.	Broadcast.	Set pointer to 1450 kc. on dial.	A7 (Trimmer C14) only	Readjust for maximum output (oscillator trimmer), if necesscary.
6	"	7.5MC	Short wave 1.	Set pointer to 7.5 mc. on dial.	A10 (Trimmer C13).	Adjust for maximum output.
7	"	6.5MC	Short wave 1.	Tune for max. output.	A11 (Trimmer C4).	Adjust for maximum output.
8	" Bandspread slug halfway out of L6.	22.5MC.	Short wave 2.	Set pointer to 22.5 mc. on dial.	A12 (Trimmer C8).	Adjust for maximum output.
9	"	21.5MC.	Short wave 2.	Tune for max. output.	A13 (Trimmer C6).	Adjust for maximum output.
10	Form loop of several turns and radiate signal into receiver broadcast loop. Move ant. switch link to "loop" position.	1450KC.	Broadcast	Tune for max. output.	A8 (Trimmer C10).	Adjust for maximum output.

TYPE OF TUBES:

1—6SS7, r-f amplifier
1—12SA7, converter
1—6SS7, i-f amplifier
1—12SQ7, detector, a.v.c., audio amplifier
1—12SQ7, phase inverter
2—35L6GT, push-pull power output
1—117Z6GT, rectifier

POWER SUPPLY: A.c. or d.c.

VOLTAGE RATING: 105-125 volts

POWER CONSUMPTION: 40 watts

CURRENT DRIN: 0.34 amp. at 117 volts a.c.

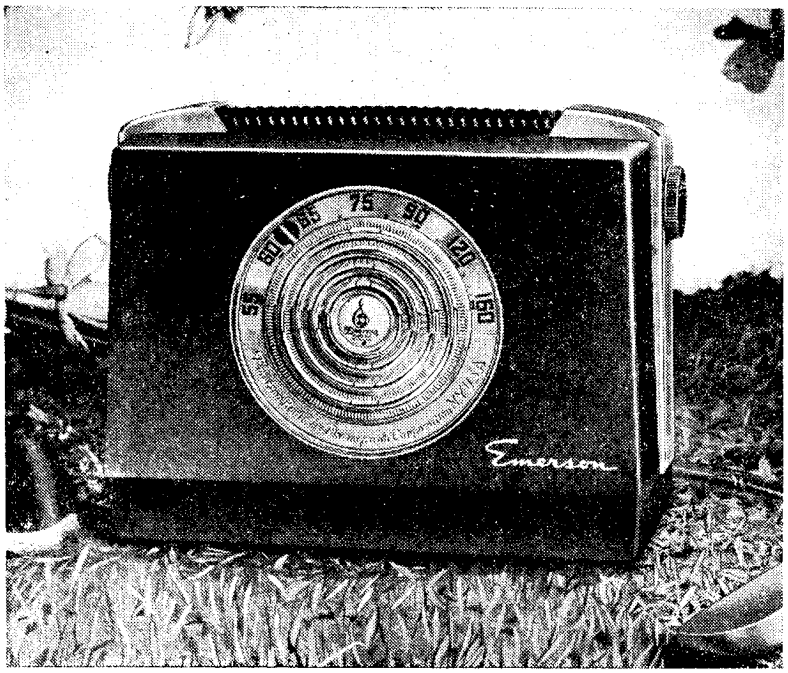
MODEL 613, Ch. 120085A, 120085B

SERVICE NOTES

MODEL: 613

CHASSIS MODELS 120085A, 120085B



DESCRIPTION

TYPE: Three way (battery, a.c., d.c.) portable superheterodyne.

FREQUENCY RANGE: 540-1620 KC.

TYPE OF TUBES:

1—1R5, pentagrid converter
1—1U4, i-f amplifier
1—1U5, detector, a.v.c., a-f amplifier
1—3V4, or 3Q4, power output
1—Selenium rectifier

POWER SUPPLY: "A" and "B" batteries, or a.c., or d.c.

VOLTAGE RATING:

Line operation—105-125 volts, a.c. or d.c.
Battery operation—1½ volts "A" supply
67½ volts "B" supply

POWER CONSUMPTION: Line operation, 20 watts

CURRENT CONSUMPTION:

"A" battery—.250 amp.
"B" battery—.009 amp.
117 volts a.c.—.170 amp.

GENERAL NOTES

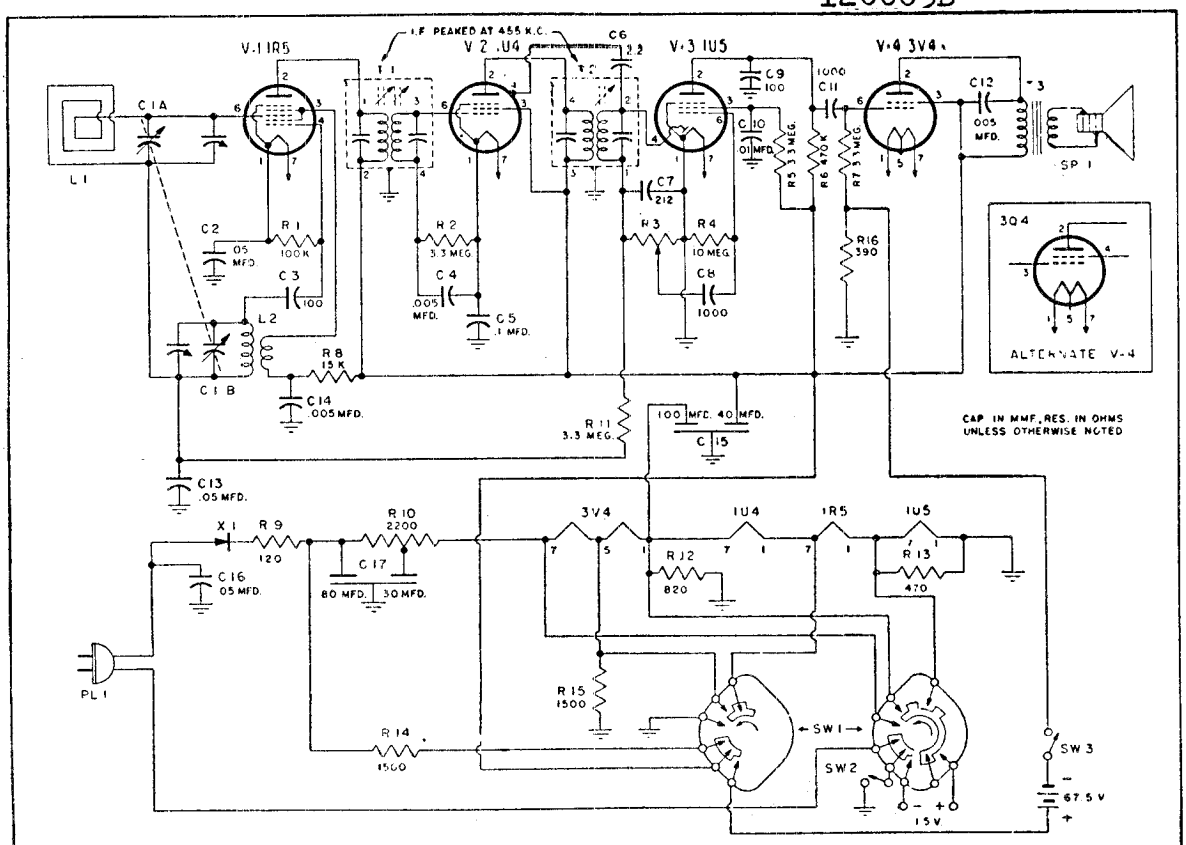
1. Line Operation: Open the rear cover which is held closed by the catch studs. Remove the line cord plug from its receptacle at the right side of the chassis (looking from the rear). Remove the line cord and insert the plug into a suitable outlet. When the power supply is d.c. and the receiver remains inoperative, remove the plug, turn it half-way around and reinsert in the outlet to obtain proper polarity.
2. Battery operation: Remove the line plug from the outlet and insert in the receptacle at the side of the chassis. The receiver will not operate from batteries if the plug is out of the chassis receptacle. Coil the loose portion of the line cord and store it carefully in the space provided.
3. Battery Complement: Replace "A" battery with standard "D" flashlight cell. Replace "B" battery with 67½ volt Eveready No. 467 or equivalent.
4. The color coding of the battery cable is as follows:

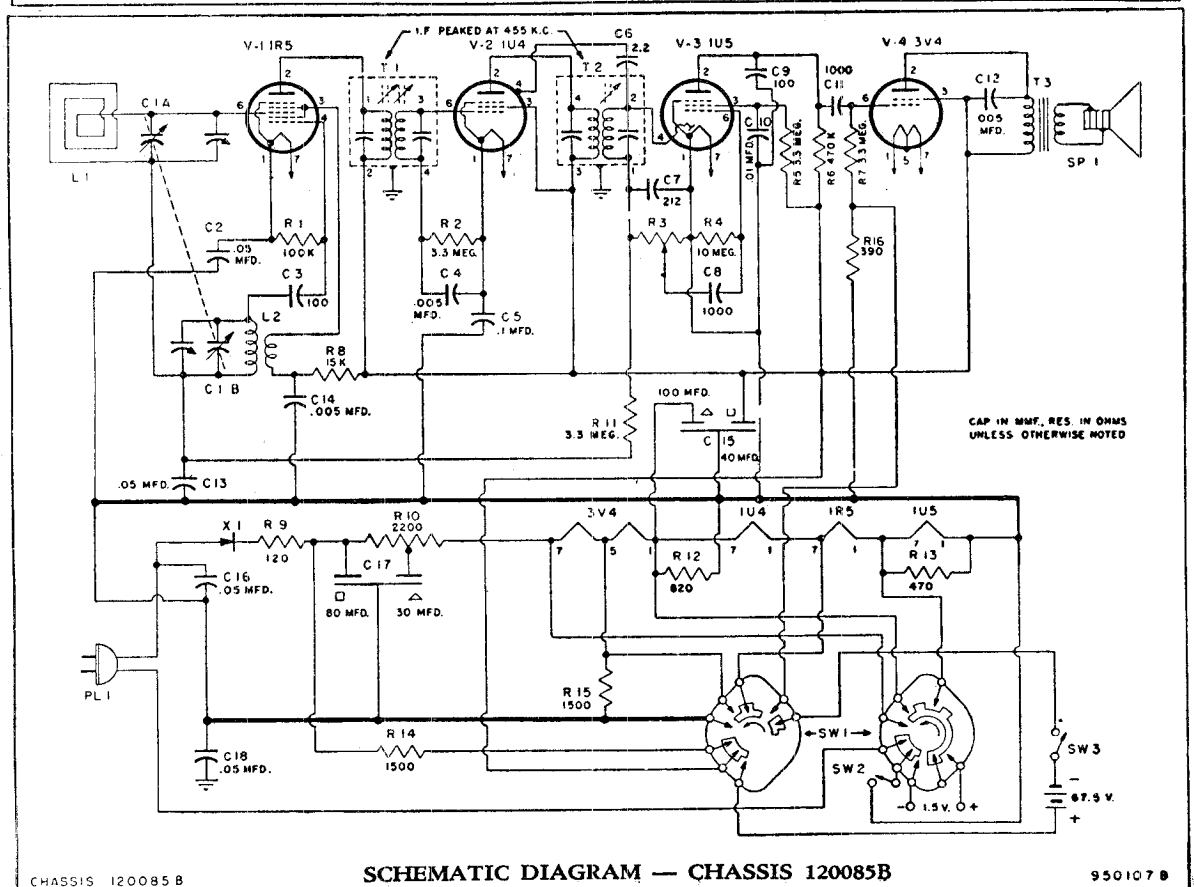
Red—B+	Yellow—A+
White—B—	Black—A—

5. If replacements are made in the r-f section of the circuit, carefully realign the receiver.
6. The receiver has a salf contained antenna and normally does not require an additional antenna connection. For installations in a location where reception is weak, connect an outside antenna to the colored lead at the rear of the cabinet. Do not use a ground connection.
7. The self-contained loop antenna has directional properties. After a station is tuned in, it is important that the set be rotated through a quarter turn to obtain the position which results in the greatest volume.

©John F. Rider

MODEL 613, Ch. 120085A, 120085B





©John F. Rider

MODEL 613, Ch. 120085A, 120085B

ALIGNMENT PROCEDURE

1. Use battery power when available. When a.c. power is used, connect the line cord through an isolation transformer if available. Otherwise connect a 0.1 mfd. condenser in series with the low side of the signal generator and B—.
2. Set the volume control at maximum. The output of the signal generator should be no higher than that necessary to obtain an output reading. Attenuate the signal input as alignment proceeds. Use an insulated alignment tool.
3. Maintain the loop in the same position relative to the chassis as when the receiver is in the cabinet.
4. Oscillator and antenna trimmers are reached from bottom of chassis.

	DUMMY ANTENNA	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
1	0.1 mfd.	High side to grid (pin 6) of V1 (1R5). Low side to chassis.	455 KC.	Variable condenser fully open.	Across voice coil.	Primary and secondary of T2 and T1.	Adjust for maximum output. If a.c. is used, without an isolation transformer, reduce dummy antenna to 200 mmf., to reduce hum modulation.
2	200 mmf.	High side to external antenna lead. Low side to chassis.	1620 KC.	Variable condenser fully open.	Across voice coil.	Oscillator trimmer on C1B.	Adjust for maximum output.
3	200 mmf.	"	1400 KC.	Tune for maximum output.	Across voice coil.	Antenna trimmer on C1A.	Adjust for maximum output.

INSTRUCTIONS FOR VOLTAGE AND RESISTANCE READINGS

1. Voltage and resistance readings are measured for 117 volt a.c. line operation.
2. Socket connections are shown as bottom views. Measurements are taken from socket pin to chassis (chassis 120085A) or socket pin to common negative (chassis 120085B).
3. Voltages are in volts d.c. and resistances in ohms, unless otherwise indicated.
4. Measurements made with voltohmyst.
5. For voltage measurements, set volume control at maximum, with no signal applied.
6. Nominal tolerance on component values makes possible a variation of ± 15% in voltage and resistance readings.

VOLTAGE READINGS

SYMBOL	TUBE TYPE	PIN 1	PIN 2	PIN 3	PIN 4	PIN 5	PIN 6	PIN 7

MODEL 643,
Ch. 120111A

DESCRIPTION

TYPE: Three way, four band, portable superheterodyne

FREQUENCY RANGE:
Broadcast - 535–1620 kc.
Short Wave 1 - 2.75–5.6 mc.
Short Wave 2 - 5.5–10.3 mc.
Short Wave 3 - 10.0–18.5 mc.

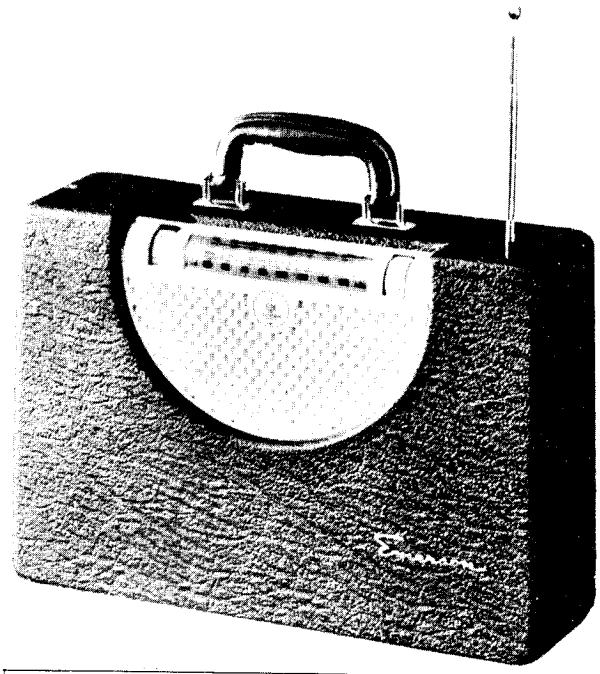
TYPE OF TUBES:
1 - 1L6, converter
1 - 1U4, i-f amplifier
1 - 1U5, detector, a.v.c., a-f amplifier
1 - 3V4, a-f power output
1 - 117Z3, rectifier

POWER SUPPLY: A and B batteries, a.c., or d.c.

VOLTAGE RATING:
Line operation - 115 or 230 volts a.c.
115 volts d.c.
Battery operation - 9 volts A supply
90 volts B supply

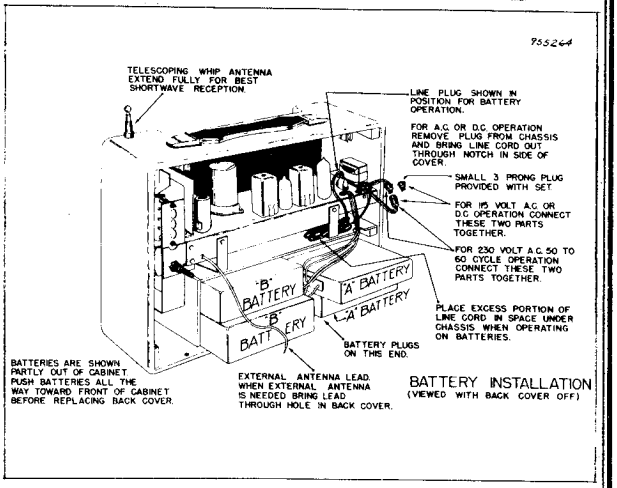
POWER CONSUMPTION: 115 volt a.c. line operation - 20 watts

CURRENT CONSUMPTION:
A battery - 0.055 amp.
B battery - 0.013 amp.
115 volts a.c. - 0.170 amp.



GENERAL NOTES

1. LINE OPERATION: Pry open the rear cover which is held closed by two catch studs. Remove the line cord plug from its receptacle at the right side of the chassis (looking from the rear). Bring the line cord out through the notch in the side of the cover.
   a) 115 volt a.c. or d.c. operation - Insert the small, three-prong plug in the corresponding receptacle, adjacent to the line cord. Insert the line cord plug in a suitable outlet. When the power supply is d.c., reverse the plug if the receiver is inoperative, to obtain proper polarity.
   b) 230 volt a.c., 50 to 60 cycle operation - Connect the small three-prong plug at the end of the line from the step-down transformer, to the receptacle adjacent to the line cord. Insert the line cord plug in a 230 volt a.c. only outlet.
2. BATTERY OPERATION: Remove the line cord plug from the outlet and insert in the receptacle at the right side of the chassis. Coil the loose portion of the line cord and store in the space provided under the chassis.
3. BATTERY COMPLEMENT: Replace the two 45 volt B batteries with Eveready No. 482 or equivalent. Replace the two 4½ volt A batteries with Eveready No. 746 or equivalent.
4. If components are replaced in the r-f section of the circuit, carefully realign the receiver.
5. The receiver has two self-contained antennas, for broadcast and short-wave reception, and normally does not require an additional antenna connection. For installations in a location where reception is poor, or where it is desired to improve reception, connect an external antenna to the colored lead at the left side of the chassis. Bring the lead through the hole provided in the back cover. The external antenna will function for all positions of the band switch.
6. The self-contained loop antenna operates only in the broadcast band and has directional properties. After a station is tuned in, it is important that the set be rotated through a quarter-turn, to obtain the position which results in greatest volume.
7. The telescoping antenna operates only for the short wave bands and must be fully extended for best reception.
8. To remove the chassis, first remove the telescoping antenna fastening screw at the bottom of the cabinet. Remove the chassis mounting screws and disconnect the broadcast loop leads. Note the color coding of the three leads and their clip connections. Remove the chassis and telescoping antenna. Loosen the clamp screw and slide off the connecting lead, together with the clamp.



955264
TELESCOPING WHIP ANTENNA EXTEND FULLY FOR BEST SHORTWAVE RECEPTION
LINE PLUG SHOWN IN POSITION FOR BATTERY OPERATION.
FOR A.C. OR D.C. OPERATION REMOVE PLUG FROM CHASSIS AND BRING LINE CORD OUT THROUGH NOTCH IN SIDE OF COVER.
SMALL 3 PRONG PLUG PROVIDED WITH SET.
FOR 115 VOLT A.C. OR D.C. OPERATION CONNECT THESE TWO PARTS TOGETHER.
FOR 230 VOLT A.C. 50 TO 60 CYCLE OPERATION CONNECT THESE TWO PARTS TOGETHER.
PLACE EXCESS PORTION OF LINE CORD IN SPACE UNDER CHASSIS WHEN OPERATING ON BATTERIES.
"B" BATTERY
"A" BATTERY
BATTERY PLUGS ON THIS END.
BATTERIES ARE SHOWN PARTLY OUT OF CABINET. PUSH BATTERIES ALL THE WAY TOWARD FRONT OF CABINET BEFORE REPLACING BACK COVER.

MODEL 643,
Ch. 120111A

CONDITIONS FOR VOLTAGE AND RESISTANCE ANALYSIS

1. Voltage readings are d.c. volts, resistance readings are ohms, unless otherwise noted. Values above line are voltage; values below line indicate resistance.
2. Voltage readings measured for 117 volt a.c. line operation.
3. All measurements made with voltohmyst, or equivalent.
4. Socket connections are shown as bottom views, with values measured from socket pin to chassis.
5. No signal applied and band switch in BC position, for voltage and resistance measurements.
6. Nominal tolerance on component values makes possible a variation of ±15% in readings.
7. On the voltage and resistance diagram, fig. 2, K = kilohms, MEG = megohms, INF. = infinity.

ALIGNMENT PROCEDURE

1. To position pointer, turn variable condenser fully closed and set pointer to reference mark on dial backplate at the low frequency end of the dial.
2. Volume control should be set at maximum position. The output of the signal generator should be no higher than necessary to obtain an output reading. Attenuate the signal input as alignment proceeds. Use an insulated alignment tool for all adjustments.
3. Use isolation transformer if available; otherwise connect a .1 mfd. condenser in series with low side of signal generator to chassis.
4. Connect output meter across voice coil for all alignment steps.
5. Refer to fig. 3 for location of alignment trimmers.
6. For BC alignment of the receiver, maintain the loop in the same position relative to the chassis as when the receiver is in the cabinet.
7. For SW alignment of the receiver, maintain the telescoping antenna closed.

STEP	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	DIAL SETTING	ADJUST	PROCEDURE
1	High side through 0.1 mfd. to grid (pin 6) of V-1 (1L6). Low side to chassis.	455 KC.	BC	Tuning condenser fully open.	T-2, T-1	Peak for maximum output. Reduce coupling condenser to 200 mmf. if isolation transformer is not used.
2	High side through 200 mmf. to external antenna lead. Low side to chassis.	1620 KC.	BC	Tuning condenser fully open.	C-24 (BC osc.)	Peak for maximum output.

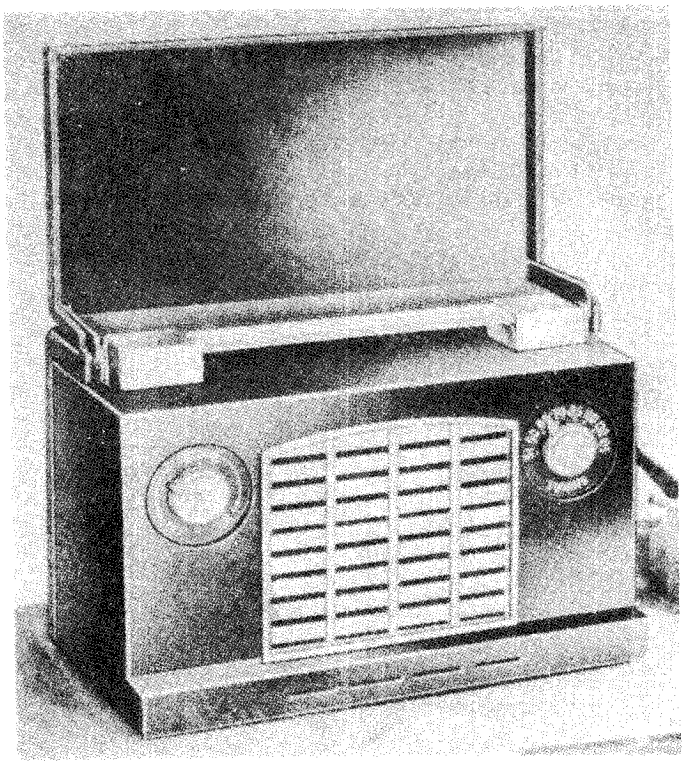
MODEL P111



Power Supply: 105-125 V., 40-60 cycles AC
Same Voltage DC—Power Consumption 10 Watts
Battery Operation: 1—67½ V B — 3—1½ V D Cells in parallel
Frequency Range: 1640 — 530 KC
I.F. Circuits: 456 KC

Tubes: 1R5 Osc. Converter
1T4 I.F. Amplifier
1S5 Det. AVC A.F.
3S4 Power Output

Rectifier, Selinium
Speaker 4" P.M. 1 oz. Alnico V Magnet.
Speaker Transformer 5500 ohms - 400 cycles
Speaker Voice Coil 3.2 ohms.

MODEL P111

ALIGNMENT PROCEDURE

No attempt should be made to realign the various circuits until all other causes have been checked, unless the condition is so obvious as to indicate that realignment is necessary. Then proceed as follows:

Disconnect Loop leads—Remove Chassis from Cabinet.
Volume Control full on.
Low range A.C. meter connected across voice coil to indicate output.
Keep signal generator attenuated so as to maintain 1/2 scale reading on output meter.
Use battery power when available.

Receiver Condenser at:	Signal Generator	Dummy Antenna	Connect Signal Generator to:	Refer to Chassis Layout for Location of Trimmers
1 Fully closed	Exactly 456 KC	.1 MF	Chassis Ground and Control Grid 1R5 Rear Section Var. Cond.	Adjust for maximum output L1, L2, L3 and L4.
2 Fully closed	Approx. 538 KC	.1 MF		Adjust for maximum output T3
3 Fully open	Exactly 1650 KC	.1 MF		Adjust for maximum output T1
Repeat Operations 2 and 3. The next two operations are performed with the chassis in the cabinet, the loop connected and tuning indicator in position.				
4 Approx. 1500 KC	Approx. 1500 KC		Radiating Loop 20" from Receiver	Adjust T2 for maximum output.
5 Approx. 600 KC	Approx. 600 KC		Radiating Loop 20" from Receiver	Adjust T3 for max. while rocking variable cond.

ALIGNMENT PROCEDURE

The chassis may be removed from the cabinet by pulling off the knobs, removing the back and the two screws on the back of the chassis.

No attempt should be made to realign the various circuits until all other causes have been checked, unless the condition is so obvious as to indicate that realignment is necessary. Then proceed as follows:

Volume Control full on.

Low range A.C. meter connected across voice coil to indicate output.

Keep signal generator attenuated so as to maintain ½ scale reading on output meter.

Make certain that dial pointer is exactly on index line (top left side of dial plate) when variable condenser is fully meshed.

Use only mild soap and water to clean cabinet and knobs. **Never use cleaning fluids.**

GENERAL DESCRIPTION

NOTE: While the descriptions and illustrations in this manual refer specifically to the Model PR-12 portable Federal Recorder, they apply to all models - console as well as portable.

Two-Piece Carrying Case

The Federal Recorder type PR-12 is built into a two-piece carrying case. The lower section houses the recorder proper with the amplifier, driving mechanism and controls. The upper section or the lid contains the loud speaker and cable bracket. In setting up for operation the case is placed so that the speaker protective grill is on the top side. Inside the lid of the case is mounted an 8-inch electro-dynamic speaker with a bracket for wrapping the speaker cable and line cord. The lid or cover of the case acts as the baffle board for the speaker.

The lid is removed from the body part of the case by unfastening the two front latches, raising as one does the lid of a suit case. After the lid is raised past the vertical position it may be unhooked from its hinges and set alongside the recorder proper or at cable length from it.

Panel Controls

All the recorder controls are located on the front panel. Referring to Figure 1, the switch marked (1) on the left-hand side of the front panel turns the amplifier on or off. This switch, however, does not control the amplifier until the speaker cable (19) is plugged into the socket (20) on the rear left-hand corner of the top panel.

The switch just below marked (2) turns the driving motor on or off. The motor may be started by this switch whether the speaker plug is in or out. The turntable (21) is engaged to the motor by the action of the control lever (14) and the holding knob (15) in a manner described in a later section.

The tone knob (3) is used to control the tone only when a record is played back. There is no provision for controlling the tone while recording. Within the frequency range of the recorder the sound is recorded exactly as it is. If it were possible to control tone while recording it could cause, at the discretion of the operator, an unnatural recording to be made.

The speaker switch (4) controls the connection of the speaker and the cutting head (27) to the amplifier output. When this switch is turned to "IN" position the loud speaker is connected to the output of the amplifier. (No recording can be made until this switch is thrown to "OUT" position.) With this switch in the "OUT" position the cutting head is connected across the output of the amplifier, the monitering meter (12) is connected to the amplifier to give a visual indication of the recording level. The loud speaker is also faintly connected to give an audible monitering of the program or material being recorded.

The gain control (5) is a fader type of volume control. When the bar type knob is turned to the left of the "center mark" under the word GAIN the volume for the radio or the playback is increased. If the right-hand switch (9) is thrown to the RADIO position the gain control acts to control radio volume. If it is thrown to PICKUP position the gain control acts to control the volume on play back. When the gain control knob is turned to the right of the "center mark" it acts to control the volume of the amplifier when microphone is used.

The jack marked MIKE (6) is used to receive the microphone plug (7) whenever a recording is to be made with microphone. This jack will accommodate any high impedance type of microphone except those requiring a polarizing voltage. The microphone used should have for best results a sensitivity falling within the range of -56 to -72 decibels.

The switch at the right-hand side of the panel marked (9) connects either the radio tuner or the pickup to the amplifier, depending upon whether it is in the RADIO or the PICKUP position. With this switch in the RADIO position, the amplifier switch on, and the speaker plug in its socket, the "Station Selector" dial (11) should light up. It requires a half minute or so for the radio tuner tubes to heat up after switching the radio on.

The Station Selector dial is calibrated in kilocycles, thereby enabling easy selection of the main stations. Stations are tuned in by the tuning knob (10).

The radio volume knob (8) is used to control the volume of the radio tuner. This acts to control the radio tuner volume before it is fed into the amplifier. The center gain control, when turned to RADIO side, acts to control the radio volume after the tuner is fed into the amplifier. The use of these two controls for regulating the volume of the radio to proper monitering level is explained in a later section.

Drive Between Motor and Turntable

The power from the motor is transmitted to the inner rim of the turntable by a rubber pulley beneath the turntable. This rubber pulley is shown in Figure 2 marked (38). It is mounted on the pulley lever (14). When the pulley lever is pushed toward the rear it engages the rubber pulley between the motor shaft (39) and the inside rim of the turntable thus enabling the motor to drive the turntable. The inside rim of the turntable is marked (40) on Figure 2. The knob (15) fastens the pulley lever into position. Pulling the lever forward draws the rubber pulley away from between the motor pulley and the turntable rim, thus disengaging the turntable from the driving motor. Do not push lever so hard as to put excess friction between turntable and motor.

When the recorder is not in use the motor must be left disengaged from the turntable. This relieves the pressure on the rubber pulley, thereby preventing the formation of a dented spot in the rubber pulley which in time might develop a thump.

Drive Between Turntable and Cutting Head

The turntable is set on a tapered spindle (41) of Figure 2. It is normally held on this spindle by the spindle thumb nut (22) of Figure 1. During recording and playback this center thumb screw is unnecessary, since the weight of the turntable holds it sufficiently solid to the tapered spindle. This spindle runs in ball bearings inside the cast gear housing (42) see Figure 7, On this spindle and inside the gear housing is a worm gear which drives a fibre gear. This fibre gear drives the shaft (43) which in turn engages with the precision ground lead screw (45) through the medium of a small worm gear and a fibre gear (44).

The lead screw finger (47) becomes engaged with the threads of the lead screw when the cutting head is lowered on to a record in the cutting position, thereby carrying the head slowly across the record while it is turning. Whenever the cutting head is raised from the record it disengages the lead screw finger from the threads of the lead screw.

HOW TO MAKE RECORDINGS WITH MICROPHONE

1. Remove top lid of case which contains speaker and set it a few feet away from recorder. (See Figure 1).
2. Plug speaker cable plug (19) into socket (20) located on the rear left-hand side of panel. This plug fits in only one position.
3. Plug power cord (18) into A. C. outlet only (100 to 117 volt 60 cycle). Converter must be used for D. C. current.
4. Put cutting needle all the way into the cutting head (27) so that flat part of the needle rests against the set screw. If a sapphire is used it is necessary to push weight adjustment (31) forward a few notches to get proper depth of cut.
5. Unscrew turntable holding thumb nut (22). This nut is left-hand thread and turns to right to unscrew. Place record on turntable (21) and on top of felt pad (24) so that the driving pin (23) engages in one of the driving holes of the record. It is not necessary to fasten the record down with the center thumb nut.
6. Get the turntable properly engaged in gear so that when you are ready to make recording you will lose no time. Do this as follows: Loosen knob (15) and push the lever (14) toward rear until you feel it engaging. Hold lever in this position and switch motor switch (2) to ON position. The turntable will start turning. Adjust the lever so that turntable is running full speed without slipping. Now tighten the lever knob (15). (A quick test for determining whether the turntable lever is adjusted properly is to press the thumb against the outside rim of the turntable gently, yet with sufficient pressure to determine that it would not slip while cutting a record.) Motor switch may be left on while making the next few operations or you can turn it off.
7. Plug microphone plug (7) into panel jack marked MIKE (6).
8. Throw speaker switch (4) to OUT position.
9. Turn amplifier on by switching AMP-ON switch (1) to ON position. The green pilot lamp (13) will light up. Allow about thirty seconds for amplifier to warm up. Note: (It is impossible to turn amplifier on unless the speaker plug has been plugged in as described in direction 2 above. The motor can operate the turntable whether the speaker plug is in or out.)
10. Switch right-hand switch (9) marked RADIO PICKUP to pickup side. This operation is not strictly essential, but it allows the radio portion of the recorder to be turned off while recording with microphone.
11. Have subject speak a few words or play a few notes in front of the microphone and turn the center gain control (5) to the right of the center mark (the side marked MIKE) until the monitering meter (12) swings and averages around the red line. Occasional audio peaks or high notes will make the needle swing full scale but the proper level is obtained when the average is around the red line.

A trial or two will enable you easily to recognize and obtain proper level. For a person talking, a good distance away from microphone is 8 to 12 inches; for singing, 12 inches to 4 feet; for instrument recording, 2 feet to 20 feet, depending upon loudness of instrument.

12. Have turntable running. Holding the cutting head (27) in right hand and cutting arm (34) in left hand bring cutting head over desired starting point on disc. Lower the cutting arm easily so as to engage it into the drive mechanism and then gently lower the cutting head on to the record. (The cutting head is adjusted at the factory to cut the proper depth on acetate record.)
13. When recording is completed, even if only a part of the record is used, lift the cutting head from the record and replace it on the armrest (35).
14. While the turntable is still running, remove the shavings from the record by working them toward the center with the finger tips, or a moderately stiff brush. Note: (These shavings are highly inflammable.)

HOW TO PLAY BACK

1. Turn the center gain control slightly to the left of the center mark (the side marked RADIO-PICKUP).
2. Throw speaker switch (4) to IN position.
3. Put a pickup needle all the way into the head of the pickup (16). Fasten the needle with the thumbscrew into the head of the pickup. (Do not turn this thumbscrew with force.)

4. Remove the pickup from its holder and place very gently on to the revolving record at the beginning of the cut.
5. Adjust the volume to desired value with the center gain control, turning it to the left of the center mark or to the side marked RADIO PICKUP.
6. The tone control (3) may be used to obtain the desired tone. This tone control is effective only on playback; it cannot be used to control the tone of the radio or when recording.
7. Commercial record may be placed by unscrewing the driving pin from the turntable. It is not necessary to fasten record down with center thumb nut when playing.

HOW TO RECORD RADIO PROGRAMS

1. To make a good radio recording it is essential first to properly tune in the station, using the load speaker as indicator. Since the radio tuner is of the tuned radio frequency type to insure high fidelity it is essential to take a little care in properly tuning and adjusting volume of radio before starting to record.
2. Connect the antenna (approximately 30 feet long) to the antenna binding post (25). A ground connection is not required for the Federal Recorder.
3. The first six directions under HOW TO OPERATE RECORDING WITH MICROPHONE apply also to making a radio recording.
4. Throw the right-hand switch (9) to RADIO. This should illuminate the station selector dial.
5. Throw the speaker switch to IN position.
6. Set the center gain control about 1/8 of a turn to the left of the center mark.
7. Set the radio volume control (8) about half way between minimum and maximum.
8. Tune in the station and program to be recorded. Do this tuning carefully, making sure that there are no interfering stations or noises. (See paragraph HOW TO USE AS HOME RADIO for additional pointers on operating radio.)
9. The proper volume for recording is obtained by using both the radio control and the center gain control. By a trial the proper setting of each control can be determined. If the radio volume control (8) is turned low and the center gain control turned high a slight distortion may be introduced. Most distortion is apt to be introduced if the radio volume control is turned high and the center gain control set near minimum. Best results will be obtained by placing the center gain control middle way between maximum and minimum and then adjusting to proper volume with the radio volume control.
10. Throw the speaker switch to OUT position but before doing so make sure the radio volume is turned near minimum; otherwise the volume may be too great for the monitering meter.
11. Raise the radio volume with the radio volume control until monitering meter averages around the red line.
12. Proceed with recording as in directions 12-13-14 under HOW TO OPERATE RECORDING WITH MICROPHONE.
13. It is possible to cut into any "off the air" recording and make a personal comment. This is done by inserting the microphone plug into the "mike" jack and turning the center gain control from its radio position to the mike position - that is, from left to right. This fades the radio program out and brings the microphone into play. When comment has been made into microphone you may get back to the radio recording by turning the center gain control back to where it originally was set.

HOW TO USE AS PUBLIC ADDRESS SYSTEM

1. Plug microphone into jack on panel marked MIKE.
2. Have radio turned off. This is done by having the right-hand toggle switch to PICKUP position.
3. Turn amplifier switch to ON position.
4. Throw speaker switch to IN position. Turn center gain control to right, on "mike" side of the center mark, until desired volume is obtained.

When using the Federal Recorder as a Public Address system it is necessary to have the loud speaker and the microphone removed from one another by considerable distance in order to eliminate the howling due to acoustic feed back between speaker and mike. Speaker should be ahead of microphone and microphone turned at 180 degrees from speaker. Best results may be obtained by using an extension cable and having the microphone isolated from speaker. The extension cable can be obtained from the Federal Recorder Company.

HOW TO USE AS A HOME RADIO

Although it is not one of the major intents of the Federal Recorder machine, it can be used as an ordinary home radio set.
Since the radio tuner and amplifier are of the high fidelity type for the express purpose of making true radio recording, it cannot be used with the same flexibility and type of control as is a commercial type home radio. The tuner does not have as good sensitivity or selectivity as the 9 or 10-tube superheterodyne commercial receivers nor will it control with the same ease. However, with the station properly tuned in, the fidelity will greatly surpass the commercial receiver. The radio tuner is purposely built this way to insure exact reproduction of the radio program, even though a little care is required to get the station properly tuned in.

An antenna about thirty feet long will give satisfactory results. Connect to antenna binding post (25) in Figure 1, No ground is necessary.
Set the center gain control about mid way to left and control volume with radio volume control.

PROTECTION OF MONITERING METER

The volume required for proper recording is considerably less than the normal output of the amplifier. With this in mind the following precaution must be observed for the protection of the monitering meter: Never have radio or microphone gain turned up high when switching the speaker switch to the OUT position for making a recording. Always start with a low gain and raise it to the required level.

ADJUSTING CUTTING HEAD USE OF CUTTING DEPTH GAUGE

The cutting head is adjusted to the proper cutting angle at the factory and ordinarily need never be changed. The pressure of the cutting needle on the record determines the depth of the cut into the acetate coating. If the cut is too light, the groove will not be deep enough for the pickup needle to follow on playback. The pickup will either jump out of the groove or else act to straighten out the groove and destroy the wavey track representing the recorded material. If the cut is too deep the cutting head must labor, in order to impress the vibrations of the cutting needle into the coating, so that some of the original frequencies will not be recorded. This means an unnatural recording and produces what is sometimes called an echo.
The position of the counter balance weight (31) on the slide rod (30) controls the depth of the cut.
The proper position of the counter balance weight is determined with the aid of the Depth Gauge (46 of Figure 6) which is furnished with each Federal Recorder.
The depth gauge consists of a piece of spring material fastened into a small block. Near the tip end of the spring is a small round dent. The gauge is held on the surface of the record with the finger so that the point of the cutting needle sets in the small dent on the spring. The proper adjustment of the balance weight is obtained when the tip of the spring is caused just to touch the surface of the record, with the cutting arm fully engaged into the lead screw.
NOTE: In order to make sure that the cutting arm is in the proper cutting position and fully engaged in the lead screw gear it is well to allow the turntable to turn a few rounds with only the cutting head lifted slightly off the record. The adjustments of the balance weight must be done with the felt pad between the turntable and the record.

CARE TO BE TAKEN WHEN CARRYING

After completing a recording and just before closing it up to move to another position make sure that the center thumb nut (22 of Figure 1). is tightened. This holds the turntable fast on the spindle, preventing it from falling off and doing damage to the rest of the machine.
It is advisable to remove the needle from the pickup since any bump against it can cause damage to the crystal located in the head of the pickup. Make sure the pickup is rigidly held in its support.
Fasten the cutting head securely with the thumb nut on the cutting head rest (35).
Make sure that the speaker cable and power cord are wrapped so that the plug ends of the cord do not flop around into the speaker cone or the other parts on the top panel.

CLEANING DRIVE MECHANISM

It is necessary often to remove the turntable and clean bits of shavings and dirt away from the rubber drive pulley (38 of Figure 2). Particular care must be taken to see that the driving face of the rubber pulley is kept free from grit and shavings. A small bit of shavings stuck on the pulley will cause a thumping noise which may be recorded into the record with the program, or distort the recording.
The driving face of the rubber pulley can be cleaned with alcohol or Carbona (Never gasoline).

It is often necessary to wipe out the inner rim of the turntable, especially the track where the rubber pulley runs. Sometimes it is necessary to remove grease or dirt films from the motor pulley (39 of Figure 2).
The lead screw (45 of Figure 7) must be kept free of dirt, shavings and especially any small gritty particles. Every few months the threads of this screw should be cleaned with a brush and alcohol, and then greased, (see section under LUBRICATION).

LUBRICATION

Following is a list of the places to be lubricated, showing the kind of lubricant and how often it should be used.
1. The rubber pulley bearing (38A of Figure 2): To lubricate the rubber pulley unscrew the round head screw holding it in place and remove it from its shaft. After cleaning put a small bit of automobile chassis lubricant or ordinary vaseline inside and on the lower shoulder of the fibre bushing in the rubber pulley. Replace pulley and fasten with holding screw and washer.
This pulley should be greased every few days, depending upon amount of use.
2. The cutting head pivot screws (33 of Figure 6). should be oiled with a drop of light machine oil every two or three weeks, depending upon amount of use. The cutting head should always be free to turn on these two pivot screws in order that the cutting head can follow any up and down movement while it is cutting.
3. The lead screw pivot points (48 of Figure 7) occasionally require a small amount of chassis grease.
4. The lead screw threads should be kept greased with a little chassis grease or vaseline.

©John F. Rider

©John F. Rider

This may be applied with the tip of the finger through the opening in lead screw cover (45 of Figure 7).

5. The cutting arm guide rod (49 of Figure 2). must be kept oiled throughout its length with a light grade of machine oil.

This rod should be oiled whenever it is seen to be getting dry or when the cutting head arm ceases to move freely from inside of record to outside or outside in when moved by hand.

6. The grease retaining cup which houses the lead screw textolite gear should be kept filled with an automobile chassis lubricant. Some lubrication may be required every three or four months (50 of Figure 7).

7. The driving motor (51 of Figure 7) has two small oil holes close to the rubber mounting rings (53) which require a couple of drops of very light oil every few months depending upon amount of use.

HINTS FOR ACETATE RECORDING

The shaft of the SAPHROID needle has a flat portion along its length and the needle should be inserted so that the set screw tightens up against this flat.

The "V" shape needle has no flat portion but has an indentation just above the point. This indentation faces you when held in front of the cutting head.

Insert needle all the way into the cutting head. It is of great advantage to use a sharp needle, as this will minimize surface noise. We suggest setting aside one record for test purposes. Then test each needle by cutting a few lines on this record. If the needle cuts quietly, reproduction will be quiet. If the needle is dull, it will hiss and squeak loudly, resulting in noisy reproduction. A simple way to check is to put one's ear as close as possible to the needle and listen to the cutting. Under proper conditions, the needle noise should be barely audible. All Federal Recorders come adjusted with the proper needle angle. This angle, when facing the cutter, is 95°. If necessary, the angle may be changed by adjusting the screws in back of the cutter head as shown in Figure 6.

In cutting, the shavings should be kept away from the cutting needle. If your machine is made to cut from the "inside-out" the shavings will automatically take care of themselves. Occasionally, in starting the thread may catch at the needle. If this occurs, push it away toward the center. When cutting from the "outside-in" both cutter and shavings are travelling in the same direction and more care must be taken to see that these shavings are clear of the cutting needle. This can be done by using a soft brush or by using the finger-tips lightly.

Do not press fingers or brush on record while cutting as this tends to slow down record and produce "wows" in the recording that are noticeable when playing back.

NOTE: A few drops of high grade machine oil, when spread over the surface of an acetate record before recording, will result in a smoother and more quiet cut. This procedure is especially beneficial when using discs which are either cold or have hardened due to age.

HINTS FOR USE OF MICROPHONE

A few trial recordings with the microphone will enable one to become familiar with a few of the "tricks" in recording to obtain best results.

For voice recordings, where the level is at a natural conversation, the microphone should be held from about eight inches to two feet from the mouth.

For singing, a distance of from two to eight feet will be found most suitable.

For recording piano, a distance of from six to fifteen feet gives the best results. When recording a piano, place the microphone on the high side of the keyboard so that the high notes will come through better. These distances are somewhat governed by the surroundings and the type of room.

Where the recording of an orchestra is to be made, the highest toned instruments should be closest to the microphone. For recording an orchestra in a room where sound reflection from the ceiling may cause reverberation it is best to place a cloth over the microphone when it is tilted face up.

If the microphone is tilted with the face up it is essentially non-directional and will give best recording where sounds all around the microphone are to be recorded.

TROUBLES AND REMEDIES

Excessive Needle Scratch

Needle scratch is caused by a defective needle, a faulty or chilled record, or recording at too low level.

A poor grade acetate record blank often has grit or hard spots. This will cause excessive scratch. Use only good grade acetate records. The Federal Recorder "Perma Disc" is one of the quietest records known and in general runs very consistent as to softness.

When recording is at too low level excessive amplification is required on playback. This brings out scratch and background noises. Cut all records so that the moniter averages around the red line.

Cutting Needle Runs in Single Groove

If the cutting needle runs in single groove the lead screw finger is not engaging in the lead screw.

Cutting Through Coating Into Aluminum Disc

If the cutting needle cuts through into the aluminum disc the cutting depth is too great. To correct this follow the instructions for the use of the depth gauge in one of the preceding sections.

Playback Needle Will Not Track

The failure of the playback needle to track may be caused by either a dull playback needle or too light a cut on the record.

If the playback needle is very blunt it may be too large to fit into the groove in the record. The only remedy in this case is to replace the needle.

If the cut is not deep enough the playback needle cannot follow in the groove. To correct this adjust to proper cutting depth. A properly cut groove gives a black and shiny shaving about the thickness of ordinary human hair.

Cutting Head Not Free to Move Up and Down

This is due to the cutting head pivot screws (33 of Figure 6) being too tight or requiring a bit of oil. The cutting head should be free enough to follow any up and down movement of turntable.

Playback Needle Repeats in Single Groove

This may be due to over cutting or because of shavings becoming tangled in cutting needle while recording.

When shavings become entangled about the cutting needle they may pull on the needle or lift it from the record and set it into the next groove. In cutting, the shavings should be kept cleared from the needle. See the notes under HINTS FOR ACETATE RECORDING.

If recording is done at too high a level some note or word in the recording may occur at greater than normal level, causing the cutting needle to make a cut in the space intended for the adjacent groove. This is sometimes called "cutting into next groove". The only remedy in this case is to lower the recording level. Record so that the average swing of the monitor is around the "red line."

Turntable Growls

This may be caused by shavings getting under the turntable and getting caught into the rubber drive pulley. See notes under CLEANING.

Chatter of Cutting Head

Chatter is caused usually by one of four things:

1. Needle may not be inserted tightly into cutting head.
2. Loose pivot screws.
3. Improper angle of needle on record.
4. Dirt between the finger and the lead screw. The proper cutting angle is made at the factory and ordinarily need not be corrected. This angle can be changed by the adjusting screw on the back side of the cutting head bracket. For correct cutting angle see illustration of Figure 7.

Wows or Wavering

A wow is described as a noticeable and unnaturaly change of pitch in a musical note. This effect is most noticeable on long sustained notes. This change of pitch is caused by a change of speed in the turntable while cutting. This is caused by slippage or a momentary loss of inertia in the turntable while recording, too deep a cut or a chilled record.

Any slippage in the drive mechanism while recording will cause a wow. This may be caused by dirt or grease on the motor shaft or rubber pulley. Improper adjustment of the pulley lever (14 of Figure 2, will cause slippage.

A hard spot on the record will act to slow the turntable down while recording which will cause a wow on play back.

A cold record is a very common cause of wows. When the temperature is low the acetate coating becomes hard, making it difficult to cut properly.

Radio Whistles When Tuning Station

This is caused by the radio tuner being out of line or improperly trimmed up. A proper alignment of the radio tuner stages will correct this whistle. Often the tuner may be only partly out of trim causing whistle when radio volume is turned up full. In such case it is usually satisfactory to keep the radio volume control turned below this point.

Radio Insensitive

This can be caused by either a bad tube in the radio tuner or by the tuner being considerably out of trim.

Amplifier Troubles

Troubles and remedies in the radio and amplifier cannot be outlined in such a manner as to be beneficial to the average Recorder owner. All such troubles should be taken up only by a reliable service man or authorized service station.

CARE OF RECORDS

The acetate material used for coating records is unstable chemically because of the use of volatile materials to give the coating plasticity. Open storage, cold, or heat acts to make the coating brittle or harder. This in turn tends to make noisy recordings.

NOTE: The records themselves are not highly in lammable because of the metal base. The shavings, however, are highly inflammable and should not be disposed of in a careless manner.

MODEL 12LP,
Little Pro

IMPORTANT INSTRUCTIONS

Regular phonograph speed of 78 RPM is obtained when rubber motor pulley is in standard position with the larger diameter at top. For 33-1/3 RPM, remove the little spring at top, lift up pulley, and replace with small diameter at top. Pointer lever can then be moved to "33" as marked on plate. Be sure to replace spring before starting motor. Always lock roller arm so that it will not move when machine is in operation

In playing commerical records, it is not necessary to remove the extra pin on the turntable. Simply place the record in position and the pin will be depressed into the turntable. Be sure when placing a blank disk on the turntable for recording that one of the three holes fits over this extra pin. This prevents the disk from slipping.

Be sure to start the turntable revolving when you engage the rubber motor pulley. This special alloy steel 17-lb. turntable is made extra heavy so that its flywheel action improves the quality of recordings. Starting it by hand prevents excessive wear on the rubber pulley.

Cutter angle

The cutter head may be adjusted by loosening screw 6 in Fig. 1 and moving recording head until stylus is in a position to produce a reflection from a blank record as shown in Fig. 4. For 90°, adjustment to angles of 87° to 89° may perform better with some stylii.

Depth of cut

This is the most important single item that will mean the difference between good and bad recordings. The depth of cut can be adjusted by turning tension screw 1 in Fig. 3. clockwise to decrease depth, counterclockwise to increase depth. This adjustment can then be locked by turning screw 2. Fig.3. clockwise. The depth should be such that the width of the space between grooves is the same as the width of the groove as shown in Fig. 5. It is very important that this relationship be maintained. If the walls are narrower than the groove, there is danger of either cutting into adjacent grooves, or deforming the wall between grooves, resulting in echoes and other spurious responses. If the groove is not deep enough, that is, the walls are wider than the groove, there is danger that the pickup will not stay in the groove.

The depth of cut may be observed with a magnifying glass or small microscope.

Alignment of recorder mechanism with respect to record surface

The recorder mechanism should be almost parallel to record surface. For best results the end nearest the outside of record should be approximately 1/64" closer to record than at the center. The object of doing this is to maintain the depth of cut at the outside and the inside of record approximately the same.

Before proceeding with alignment of the mechanism, make sure that turntable is level with edge of idler pulley as shown in Fig. 2. If this is not so, loosen screws 1, 2, and 3, (Fig. 7) and then adjust screw 4 until turntable is at proper level. Screws 1, 2, and 3 should now be tightened. Spindle 3 (Fig. 3 and 6) should fit in its socket without wobbling. As this pin wears, the fit should be checked and adjusted by raising or lowering the spindle by means of screw 5 and locked by screw 6, (Fig. 7).

Place a blank record on the turntable and then place recorder mechanism on center pin of turntable, turning knob 4 (Fig. 3) until mechanism rests on the record. The cutter should be in raised or non-recording position. Referring to Fig. 6, mounting bracket 4 should be centered in end bracket 5 and should turn freely without binding. This can be adjusted by means of nuts 1 and screws 2. Loosen set screw 6 and raise or lower mechanism by turning set screw 7 clockwise or counterclockwise until the distance between the guide rod and the record near the outside of the turntable is 1/64" greater than the distance near the center. The turntable should now be set in motion and the set screw wrench inserted in hole 8 in spindle 3, and spindle turned until the recorder mechanism can be lifted from and lowered on center pin of turntable freely or until all signs of mechanical noise or vibration such as knocking disappear. Set screw 6 should now be tightened.

Center pin

The center pin in the turntable may be pressed out and replaced. Replacement may be desirable after considerable use due to wear caused by slipping records on and off. A snug fit is necessary for recording and re-

©John F. Rider

MODEL 12LP,
Revised

producing records without "wow". The pin furnished is 0.2800 $^{+.000}_{-.001}$ inch diameter. It may be replaced by a pin 0.2835 ± .0005 inch diameter if a snug fit is wanted in reproducing commercial shellac records.

Lubrication and maintenance

Points 7, 8, and 9 (Fig. 1) should be lubricated with a light high grade oil occasionally.

The worm gear and worm wheel on recorder mechanism should be lubricated every two or three months with a light grease such as Vaseline. Pivot bearings 9 and 10 (Fig. 6) should be lubricated with a drop of light machine oil every two or three weeks.

The motor should be lubricated every two or three months by dropping a few drops of light high grade oil in hole 7 (Fig. 7).

The lead screw and guide shaft should be cleaned with Carbona. This should be done quite frequently since dust and dirt will accumulate on these parts and hinder operation of machine. If the amplifier becomes noisy, the tubes and all plug connections should be checked. The idler pulley and rim of turntable should be kept clean and free of oil and grease.

Caution - Never replace fuse with another of higher rating.

TECHNICAL DATA - Electrical

Power supply rating (complete recorder): 105-125 V, 60 c.p.s.

Instructions for Installation and Operation

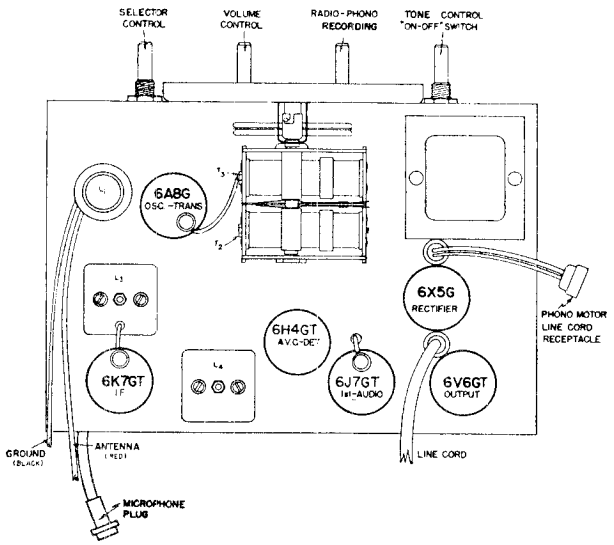
For Model 101 — Radio, Phonograph and Recorder Combination

This receiver consists of a six-tube superheterodyne phono-radio and recorder combination. An improved filter circuit, automatic volume control, a beam power output tube and oversized electro-dynamic speaker are incorporated for improved performance. The frequency range covered is standard broadcast, 530 to 1700 kilocycles. This range covers all of the standard American broadcast stations and some of the low-frequency police transmitters.

TUBES:

6A8G, 6K7GT, 6H4GT, 6J7GT, 6V6GT, 6X5G.

TUBE SOCKET LOCATIONS



ANTENNA AND GROUND CONNECTIONS:

The leadin (wire running from outside antenna to radio) should be spliced to the antenna lead (red wire) at the rear of the cabinet.

A good ground connection is of real importance. Firmly secure a wire to a water or steam radiator pipe, by means of a "Ground Clamp" designed for the purpose. The pipe must be thoroughly scraped so that the clamp makes contact with bright metal. If no such ground is available, a wire clamped to a piece of galvanized pipe which has been driven a few feet into moist earth will serve. The ground wire should be spliced to the black lead at rear of cabinet.

PHONO - RADIO AND RECORDING SWITCH:

The knob of this switch is marked with the numbers from one to five.

To receive radio programs set the number 5 opposite the small brass marker above the knob.

To play phonograph records or home recordings set the number 4 opposite the brass marker.

To make a record of a radio program set the number 3 opposite the brass marker.

To make a record of speech or music picked up on the microphone furnished with the instrument set the number 2 opposite the brass marker.

To use the equipment as a public address system set the number 1 opposite the marker.

©John F. Rider

IMPORTANT
INSTRUCTIONS FOR HOME RECORDING

INSTRUCTIONS FOR HOME RECORDING:

First place a recording needle in the head of the recorder arm. To do this loosen set-screw projecting from end and insert needle in hole on underside of recorder arm. Make sure that the set-screw is tight so that the needle is firmly held in place. Be sure that flat side of needle point faces towards the rear of cabinet. Place a blank disc on the turntable, making sure that the small pin on the turntable projects through one of the three small holes near the center of the disc. This is absolutely necessary to prevent the disc from slipping and ruining the recording.

If you wish to record a radio program set the "Phono-Radio Record" switch so that the number "5" is opposite the brass marker above the knob. Tune in the desired radio program and advance the volume control so that the program is heard loudly, but so that it is not rough or distorted. Remember the record will sound the same as the program. Noise or static if present will be recorded along with the music. Having adjusted the radio controls, set the "Phono-Radio Record" switch knob so that the number "3" is opposite the marker. The program will still be heard, but now the recording head is operating and the recording needle is vibrating in unison with the sound coming from the speaker. Raise the recorder arm and move it over the record, then lower the arm until the needle point almost touches the record. If the point is about one-quarter inch from the edge of the record lower the arm slowly and release it. If the position is not correct at the first trial, remember that the arm must be RAISED before the needle point can be relocated.

You are now recording the radio program on the record blank and the recorder will continue to operate without further attention until the needle reaches the label at the inside of the disc. When this point is reached, lift the recorder arm and return to its rest. Failure to do this will result in the needle cutting through the coating and digging into the disc, with possible injury to the recorder. During the time the recording is being made you will note a fine thread which piles up into a heap about ½ inch from the point at which the recording needle touches the record. This thread should be brushed lightly toward the center of the disc with a handkerchief or soft brush, and not allowed to collect under recording needle.

To play the record you have just made set the "Phono-Radio Record" switch knob so that the number "4" is opposite the marker, and proceed to play the same as any phonograph record.

CAUTION—NEVER play home recordings with a needle that has been used to play regular records. To do so may ruin the recording.

To record from microphone, insert microphone plug into connector as shown in drawing. Set "Phono-Radio Record" switch so the number "1" is opposite the marker. Speak into microphone and advance volume control until speech is reproduced from the loud speaker in the set. This is simply a test to indicate that the microphone is operating properly. Next set "Phono-Radio Record" switch so that the number "2" is opposite the marker. Turn volume control to right as far as possible. The recording head is now functioning and you proceed to make a recording of voice or music from the microphone in exactly the same manner as the radio recording was made. In recording speech keep microphone at least six inches from your mouth and speak in a normal tone of voice.

MODELS 111, 116

ALIGNMENT PROCEDURE

GENERAL DATA

The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE

The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast band should be aligned.

I.F. ALIGNMENT

With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6A8GT) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis base. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT

Connect the antenna to the generator through a 200 MMF dummy and the ground of the set (Black wire) to the generator ground. Set the dial and generator at 1720 KC. Align the BC oscillator trimmer for maximum output. Set the generator at 1400 KC and tune-in signal with the dial. Adjust antenna trimmer for maximum output. Next set the generator at 600 KC and tune in the signal with the dial to check if the gang condenser or coils have been damaged. This receiver requires no adjustment at this point as it employs a cut section gang.

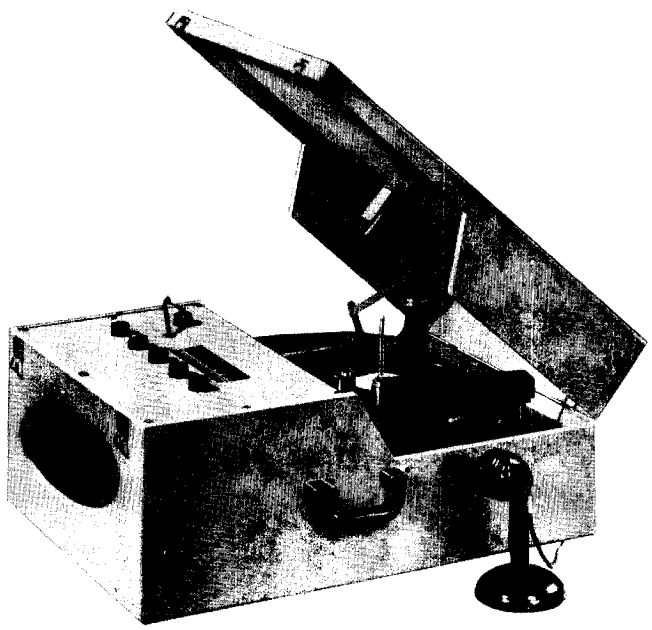
Federal Recording Radio
No. 118 Dual Speed Portable



Federal Recording Radio
No. 119 Portable with Record Changer

POWER SOURCES

This instrument will operate on 110 to 125 volt—60 cycle current only. Never plug into a higher voltage line or the parts will be seriously damaged. Never use current of any other frequency than 60 cycles, as the motor in this instrument is made for 60 cycle operation only. If you are in doubt about your home current, you should consult your local power company.

ADJUSTMENTS

If it is necessary to adjust the cutting arm proceed as follows:

1. With the turntable stopped, lower the cutting arm over the turntable so that the stylus rests on the disc. Measure the distance between the disc and the bottom edge of the arm. This distance should be ¼ of an inch. The cutting head will extend slightly below the bottom of the cutting arm, but the distance should be measured from the bottom of the cutting arm. The best spot to make this measurement is at the end of the arm, just below the opening from which protrudes the knurled thumb screw which locks the stylus into the cutting head. When properly adjusted, the thumb screw will be approximately in, or slightly above, the center of the opening in the end of the arm. If the arm is lower than ¼ of an inch, raise the arm to a vertical position. Loosen the lock nut on screw 'A' (see fig. No. 2) and turn the screw to the left. Lower the arm again onto the disc and make your measurement. Do this until the proper distance is set. Then retighten the lock nut to hold the screw into place.

If the arm is higher than ¼ of an inch, turn screw 'A' to the right until the proper setting is made.

After the correct adjustments have been made on screw 'A', it is only necessary to turn the screw 'B' (see fig. No. 2) to the right to increase the width of the groove or to the left to decrease the width.

ALIGNMENT PROCEDURE

Remove the chasis from the cabinet before attempting to align this receiver. To do this, proceed as follows:

Loosen and remove the four screws from the four corners of the motor plate. Next, loosen and remove the four wood screws in the control panel. Remove the control knobs by pulling straight up on the knobs. Raise up the motor plate and lift out the control panel. Pull out the plugs connecting the motor plate to the chassis. Loosen and remove the four screws in the front end of the cabinet and lift out the chassis.

©John F. Rider

A signal generator having the following frequencies is necessary: 456KC, 600KC, 1400KC, 6MC, 16MC, 18.3MC. An output meter of some kind should be connected across the speaker leads at the output tube.

When aligning this receiver, always keep the volume control turned full on and the generator output as low as possible. See Fig. No. 3 for location of adjustments.

I. F. ALIGNMENT: Connect the leads from generator to the stator plates of the 'RF' section of the gang condenser, through a .05 condenser. Make sure that the ground lead from the generator is connected to some point on the chassis.
Adjust the generator to 456KC.
Adjust the four trimmer screws in the I.F. cans until a maximum reading is noted on the output meter. The gang condenser should be turned all the way out during these adjustments.

'B' BAND ALIGNMENT: Connect the generator leads to the 'Ant' and 'Gnd' leads of the chassis through a .0002 condenser. Set the generator to 1400KC and turn the tuning control until the pointer is directly over 140 on the 'B' band scale. If necessary, adjust the 'B' band oscillator trimmer, (which is located underneath the chassis) until the 1400KC signal from the generator is heard. Next set the generator to 600KC and tune the receiver until the 600KC signal is tuned in. Turn the 'B' band padding condenser very slowly to the right or left and at the same time rock the tuning control back and forth until a maximum reading is noted on the output meter. Next reset the generator to 1400KC and tune the receiver to 140 on the scale. If the signal has shifted, then readjust the 'B' band osc. trimmer. Place the loop antenna so that it is in approximately the same relative position as it would be in the cabinet. With the generator still at 1400KC and the receiver still tuned to 140 on the scale, adjust the 'B' band loop antenna trimmer till the output meter shows a maximum reading.

"D" BAND ALIGNMENT: Connect the generator leads to the "Ant." and "Gnd" leads of the receiver through a 400 ohm resistor. Turn the tuning control so that the pointer is at the extreme right end of the 'D' Band scale. Set the generator to 18.3MC and adjust the 'D' band osc. trimmer, till the signal is heard. Make sure that you hear the fundamental frequency and not the image. This may be checked by tuning the receiver to approximately 17.4MC while the generator is still at 18.3MC. At this point, you should hear a weaker signal which indicates that it is the image frequency. Next set the generator to 16MC and tune the receiver to 16MC. Tune the signal in carefully. Adjust the 'D' band antenna trimmer and at the same time rock the tuning control back and forth till a maximum reading is noted on the output meter. Next set the generator to 6MC and tune the receiver to that signal. No adjustment should be necessary at 6MC. A fixed oscillator padding condenser is used for this frequency.

INSTALLATION

POWER SUPPLY. This receiver is designed for operation on a power supply of 110 to 120 volts, 60 cycle, alternating current. Before inserting power plug, be sure that your house is wired for the correct voltage and current for which this set is designed. If you are in doubt, call up your local power company for the necessary information. Never plug into a direct current (DC) outlet.

ANTENNA AND GROUND CONNECTIONS. This receiver has a built-in loop antenna and ordinarily will require no external antenna. The excellent design of this loop is such as to give maximum pickup from stations having wide variations in signal strength. In poor localities for reception, such as locations in metal buildings, near iron ore deposits, steel structures, or in localities remote from broadcasting stations, reception can be improved by using an outside antenna with a length of from 50 to 100 feet including lead-in. This lead-in is connected to the **blue** lead extending from the chassis. The loop antenna will also work on the short wave band, but to obtain maximum reception on the short waves it is advisable to use an outside antenna.

A good ground connection is necessary to secure maximum performance on both radio and recorder. Connect the **black** ground wire to a water pipe or steam radiator by means of a ground clamp. The pipe should be thoroughly cleaned so that this clamp makes a positive contact with the metal. If no ground is available, one can be made by driving a piece of pipe into moist earth.

LOCATION OF CABINET. If the cabinet is placed close to a flat wall it is necessary to allow a minimum space of 3 inches between the rear of the cabinet and the wall. This is necessary to secure proper tone quality and ventilation for the radio. The cabinet should stand firmly on its four feet. If the cabinet wobbles, fold up a piece of paper and place under the leg which does not rest securely on the floor.

ALIGNMENT DATA AND SERVICING

Lack of sensitivity and poor tone quality may be due to **any one or a combination of causes such as weak or defective tubes or speaker,** open or grounded bias resistor, bypass condenser, etc. **Never attempt to realign set until all other possible sources of trouble have been** first thoroughly investigated and definitely proved not to be **the cause.**

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, 1720, 6000, 15000 and 18300 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the **first step.** After the I.F. transformers **have been** properly adjusted and peaked, the Broadcast and Short Wave bands in the order given, **should** be aligned.

I.F. ALIGNMENT. With the **wave switch** in the Broadcast Band and the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first **detector** tube (6A8GT) through a .05 or .1 mfd. condenser. The **ground** on the test oscillator should be connected to the chassis buss. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. With the switch turned to the broadcast position, connect the antenna to the generator through a 200 MMF dummy and the ground of the set (Black wire) to the generator ground. Set the dial and generator at 1720 KC. Align the BC oscillator trimmer for maximum output. Set the generator at 1400 KC and tune-in signal with the dial. Adjust antenna trimmer for maximum output. Next set the generator at 600 KC and tune in the signal with the dial. Adjust the BC pad by rocking the gang back and forth while adjusting the pad until maximum output is attained. Recheck the adjustment at 1400 KC as the pad adjustment may have caused misalignment.

SHORT WAVE BAND ALIGNMENT. With the band switch turned to the S. W. position, connect the generator to the antenna with a 400 ohm dummy and the ground of the set (Black wire) to the generator ground. Adjust the S. W. oscillator to give a maximum output with the dial at 18300 KC (extreme end). Set the generator at 15000 KC and tune-in the signal with the dial. Adjust the antenna trimmer for maximum output. With a strong signal input turn the dial to approximately 1 M. C. lower in frequency and pick up the image frequency. If the image is not received, it will be necessary to return the dial to 18300 KC to reduce the capacity in the oscillator trimmer until a second signal is received. Proceed as before with the alignment of the antenna and recheck for image frequency. Check the sensitivity at 6000 KC to determine if the coils and mica pad **are not defective.**

ALIGNMENT DATA AND SERVICING

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast band should be aligned.

I.F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis base. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the antenna to the generator through a 200 MMF dummy and the ground of the set (Black wire) to the generator ground. Set the dial and generator at 1720 KC. Align the BC oscillator trimmer for maximum output. Set the generator at 1400 KC and tune-in signal with the dial. Adjust antenna trimmer for maximum output. Next set the generator at 600 KC and tune in the signal with the dial to check if the gang condenser or coils have been damaged. This receiver requires no adjustment at this point as it employs a cut section gang.

ALIGNMENT DATA AND SERVICING

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast band should be aligned.

I.F. ALIGNMENT. With the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis base. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the antenna to the generator through a 200 MMF dummy and the ground of the set (Black wire) to the generator ground. Set the dial and generator at 1720 KC. Align the BC oscillator trimmer for maximum output. Set the generator at 1400 KC and tune-in signal with the dial. Adjust antenna trimmer for maximum output. Next set the generator at 600 KC and tune in the signal with the dial to check if the gang condenser or coils have been damaged. This receiver requires no adjustment at this point as it employs a cut section gang.

RECORD CHANGER SERVICING

(1) Lever for setting to play 10-inch or 12-inch records, Manual playing or Remove records. Mechanism as shown is set for playing 10-inch records.

(2) "On" and "Off" switch for operating the record playing mechanism. Not used on some models.

(3) Trip mechanism designed to handle automatically records with either spiral run-in or oscillating grooves.

(4) Record Support Fingers.

(5) Turntable Shaft.

(6) Trip Rod Tension Spring.

(7) Adjustment for run-in or spiral-grooved records.

(8) Adjusting lock screws for controlling position of power take off wheel (12).

(9) Rubber-tired Drive Wheel. By means of a spring, this wheel contacts the steel pulley on the motor and the inside flange of the turntable; driving the table in clockwise rotation.

(10) Adjusting screws for locking tone arm in position so that needle will rest properly on edge of record.

(11) Trip rod.

(12) Rubber-tired power take-off wheel. Through the trip mechanism, this wheel contacts the inside flange of the turntable during the change cycle from one record to the next, but does not operate during the playing of a record.

(13) Pickup Arm.

(14) Needle Set Screw.

(15) Record Support Arm.

(16) Master Trip Cam.

(17) Mounting Holes. Rubber washers or springs should be used when bolting changer in cabinet to absorb possible vibration.

(18) Reject Button. By pressing this button, changing mechanism operates immediately regardless of needle position on the record. Also by pressing this button, the first record will drop on turntable.

(19) Position for Lever (1) when playing 12-inch records.

(20) Position for Lever (1) for Manual playing, Removing records or Cutting records.

(21) Adjusting screw for setting vertical movement of tone arm. If properly set, no further adjustment will be necessary.

(22) Adjustable Tie Bar used for positioning record support arms. The adjustment of this bar properly made should require no further attention.

(23) Rim Drive Electric Motor. Be sure Voltage and Cycles are correct for your Power Line.

(24) Cutter Arm. At all times except when actually recording, cutter arm is placed on cutter arm support rest (28).

(25) Adjusting Screw by which the tension on the cutter head equalizing spring may be varied for different types of records.

(26) Cutting Stylus clamp screw.

(27) Adjusting screw and lock nut for proper spacing between cutter arm and record.

(28) Cutter arm support rest. Prevents interference with reproduction and also removes all strain on cutter-head equalizing spring. Full lines show shipping position—dotted, Installation Position.

(29) Lead Screw.

(30) Follower Arm and Spring Cam. This arm and cam mesh with lead screw (29) to provide lateral motion of cutter arm during recording.

(31) Depressible Pin in turntable for driving home recording disc.

ALIGNMENT DATA AND SERVICING

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 456, 600, 1400, 1720, 6000, 15000 and 18300 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the Broadcast and Short Wave bands in the order given, should be aligned.

I.F. ALIGNMENT. With the wave switch in the Broadcast Band and the gang condenser set at minimum, adjust the test oscillator to 456 KC and connect the output to the grid of the first detector tube (6SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the chassis ground. Align all four I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. With the switch turned to the broadcast position, connect the antenna to the generator through a 200 MMF dummy and the ground of the set (Black wire) to the generator ground. Set the dial and generator at 1720 KC.

Align the BC oscillator trimmer for maximum output. Set the generator at 1400 KC and tune-in signal with the dial. Adjust antenna trimmer for maximum output. Next set the generator at 600 KC and tune in the signal with the dial. Adjust the BC pad by rocking the gang back and forth while adjusting the pad until maximum output is attained. Recheck the adjustment at 1400 KC as the pad adjustment may have caused misalignment.

SHORT WAVE BAND ALIGNMENT. With the band switch turned to the S. W. position, connect the generator to the antenna with a 400 ohm dummy and the ground of the set (Black wire) to the generator ground. Adjust the S. W. oscillator to give a maximum output with the dial at 18300 KC (extreme end). Set the generator at 15000 KC and tune-in the signal with the dial. Adjust the antenna trimmer for maximum output. With a strong signal input turn the dial to approximately 1 M. C. lower in frequency and pick up the image frequency. If the image is not received, it will be necessary to return the dial to 18300 KC to reduce the capacity in the oscillator trimmer until a second signal is received. Proceed as before with the alignment of the antenna and recheck for image frequency. Check the sensitivity at 6000 KC to determine if the coils and mica pad are not defective.

RECORD CHANGER SERVICING

(1) Lever for setting to pluy 10-inch or 12-inch records, Manual playing or Remove records. Mechanism as shown is set for playing 10-inch records.
(2) "On" and "Off" switch for operating the record playing mechanism. Not used on some models.
(3) Trip mechanism designed to handle automatically records with either spiral run-in or oscillating grooves.
(4) Record Support Fingers.
(5) Turntable Shaft.
(6) Trip Rod Tension Spring.
(7) Adjustment for run-in or spiral-grooved records.
(8) Adjusting lock screws for controlling position of power take off wheel (12).
(9) Rubber-tired Drive Wheel. By means of a spring, this wheel contacts the steel pulley on the motor and the inside flange of the turntable; driving the table in clockwise rotation.
(10) Adjusting screws for locking tone arm in position so that needle will rest properly on edge of record.
(11) Trip rod.
(12) Rubber-tired power take-off wheel. Through the trip mechanism, this wheel contacts the side flange of the turntable during the change cycle from one record to the next, but does not operate during the play of a record.
(13) Pickup Arm.
(14) Needle Set Screw.
(15) Record Support Arm.
(16) Master Trip Cam.
(17) Mounting Holes. Rubber washers or springs should be used when bolting changer in cabinet to absorb possible vibration.
(18) Reject Button. By pressing this button, changing mechanism operates immediately regardless of needle position on the record. Also by pressing this button, the first record will drop on turntable.
(19) Position for Lever (1) when playing 12-inch records.
(20) Position for Lever (1) for Manual playing, Removing records or Cutting records.
(21) Adjusting screw for setting vertical movement of tone arm. If properly set, no further adjustment will be necessary.
(22) Adjustable Tie Bar used for positioning record support arms. The adjustment of this bar properly made should require no further attention.
(23) Rim Drive Electric Motor. Be sure Voltage and Cycles are correct for your Power Line.
(24) Cutter Arm. At all times except when actually recording, cutter arm is placed on cutter arm support rest (28).
(25) Adjusting Screw by which the tension on the cutter head equalizing spring may be varied for different types of records.
(26) Cutting Stylus clamp screw.
(27) Adjusting screw and lock nut for proper spacing between cutter arm and record.
(28) Cutter arm support rest. Prevents interference with reproduction and also removes all strain on cutter-head equalizing spring. Full lines show shipping position—dotted, Installation Position.
(29) Lead Screw.
(30) Follower Arm and Spring Cam. This arm and cam mesh with lead screw (29) to provide lateral motion of cutter arm during recording.
(31) Depressible Pin in turntable for driving home recording disc.

PROCEDURE FOR SETTING THE STATION BUTTONS

Make a list of your six favorite stations, those which you tune in regularly. It is better to list the station with the lowest kilocycle number first, the station with the next higher kilocycle number next, and so on.

Grasp the left-hand button at the sides (depress the adjacent button) and pull it out as far as it will go. A click will be heard. If it is impossible to depress the button which is adjacent to the button you are setting, rotate the tuning knob a few turns.

Select the first station from the list you have prepared. *Carefully* tune in this station by means of the manual tuning knob until the dark sector in the tuning eye is narrowest.

Now lock the mechanism by pushing the button all the way in until it is felt to lock into place.

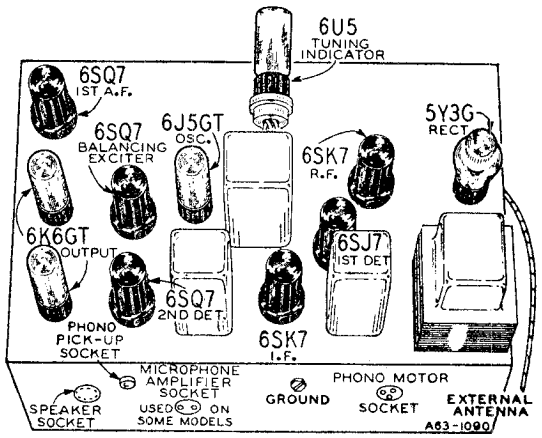
Proceed in the same manner to set stations on any of the remaining buttons. Any button may be used for any station you can receive, although it will be more convenient to set the stations so that the kilocycle numbers increase from left to right.

Remove the correct station call letter tab from the sheets supplied by bending the sheet back and forth at the score mark until the tab can be broken off. Press the tab all the way to the bottom of the space provided in the button. Cover the call letter tab with a celluloid tab, pressing this in until it snaps into place.

Changing the setting of one button will not affect the setting of any of the other buttons.

SPECIFICATIONS

Power Consumption	90 Watts (At 117 volts 60 cycles) 122 Watts (Motor Operating)
Power Output	4 Watts Undistorted 5.5 Watts Maximum
Selectivity	35 KC Broad at 1000 Times Signal
Intermediate Frequency	456 KC
Speaker	12" Electro-Dynamic
Tuning Frequency Range	
B Range	535 to 1610 KC
D Range	5.35 to 18.3 MC
Sensitivity—External Antennas—(For 0.5 Watt output)	
B Range	2.0 Microvolts Average
D Range	4.0 Microvolts Average



DRIVE CORD REPLACEMENT

Turn gang condenser to open position. Use new drive cord 55" in length.

Secure one end of tension spring to hook on drive pulley. Bend spring around drive pulley shaft—see illustration. Pass cord through slot in pulley rim. Wind cord 1/4 turn clockwise (from drive pulley end of chassis) around drive pulley. Pass cord around idler pulleys A, B, C and D as in illustration. Then wind cord 2 1/2 turns clockwise (from front of chassis) around tuning shaft spool. These turns should progress away from chassis. Pass cord over top of drive pulley for 3/4 turn clockwise (from drive pulley end of chassis) and through slot in pulley rim. Fasten cord to tension spring—see illustration.

ALIGNMENT PROCEDURE

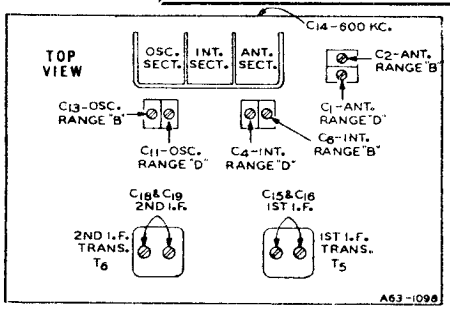
Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An all Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter — Non-Metallic Screw driver.
Dummy Antennas—.1 mf., 100 mmf., and 400 ohms.

	SIGNAL GENERATOR					
	FREQUENCY SETTING	CONNECTION AT RADIO	DUMMY ANTENNA	BAND SWITCH SETTING	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
I.F.	456 KC	Signal Grid of 1st Det.	.1 mf.	B Range	Turn Rotor to Full Open	1st I.F. (C15) & (C16) 2nd I.F. (C18) & (C19)
RANGE D	18,300 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C11)
	17,000 KC	Antenna Lead	400 Ohm	D Range	Turn Rotor to Max. Output	Ant. Range D (C1) Int. Range D (C4) Rock Rotor—See Note B
RANGE B	1610 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Full Open	Oscillator Range B (C13)
	1400 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output Set Indicator to 1400 KC— See Note A	Ant. Range B (C2) Int. Range B (C6)
	600 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output	600 KC (C14) Rock Rotor—See Note B
LOOP RANGE B	1400 KC	Antenna Lead	100 mmf.	B Range	Turn Rotor to Max. Output	Ant. Range B (C2)



NOTE A—If the pointer is not at 1400 KC on the dial, remove pointer from drive cord. Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

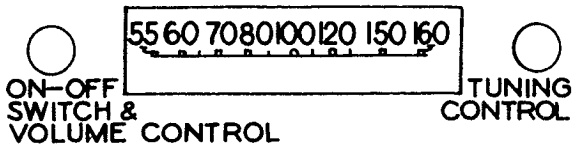
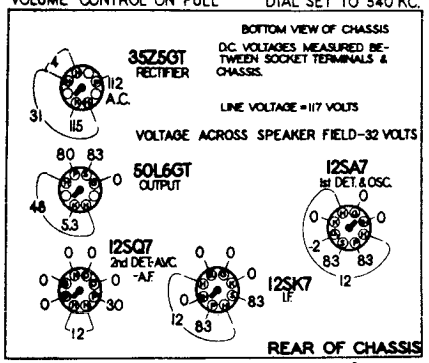
The possession of this price list by any person is not to be construed as an offer to sell to him, nor anyone else, the goods listed herein at prices stated.



SOCKET VOLTAGES

VOLUME CONTROL ON FULL DIAL SET TO 540 KC.



USE A VOLTMETER OF 1000 OHMS PER VOLT

MISCELLANEOUS PARTS

PART NUMBER	DESCRIPTION
501996	Cabinet back only
114955	Clamp - for drive cord
112764	Clip - coil mounting
116948	Cord - tuning mech. drive (6 ft. length)
117057	Cord - dial drive (3 ft. length)
502005	Dial Scale
501140	Drive - drum & bushing
501135	Drive - shaft & disc
501370	Escutcheon
501995	Knob - tuning or volume
500218	Pointer
81145	Retaining ring - for tuning shaft---Per C
85827	Set Screw - 8/32 square head
160026	Socket - condenser mtg.(used with alum. can only)
116690	Socket - octal base
500499	Socket - pilot lamp (with leads)
161384	Spring - dial cord tension
501145	Spring - tension for tuning mech.
500216	Tuning shaft
111972	Washer - extruded & tapped (mtg.)
111456	Washer - spring washer for tuning shaft---Per C
500219	Window - dial

ELECTRICAL PARTS

DIAGRAM NUMBER	PART NUMBER	DESCRIPTION
1-2	83539	Condenser - mica 260 mmfd.

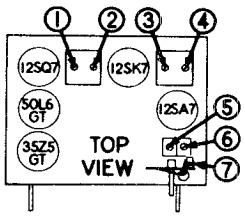
4	88686	Condenser - mica 200 mmfd.
5	112971	Resistor - insulated, 470,000 ohm ½ watt
6	112987	Resistor - insulated, 220,000 ohm ½ watt
7	116050	Resistor - insulated, 10 meg. ½ watt
8	116056	Resistor - 2.2 meg. ½ watt
9	116059	Resistor - insulated, 22,000 ohm ½ watt-
10	116092	Resistor - 140 ohm, 1 watt-wire wound
11-12	116819	Condenser - .05 mfd. 600 volt
13	118921	Lamp-Dial (Mazda #47)
14-15	119193	Condenser - .01 mfd. 600 volt
16	119875	Condenser - .002 mfd. 600 volt
17A-17B	500223	Volume Control - 1 meg. (with switch)
18	501150	Loop Antenna
19A-19B	501223	Condenser - trimmer (2 sections) (A-35 mmfd.) (B-238 mmfd.)
20	501157	Coil - antenna (with slug)
21	501158	Coil - oscillator (with slug)
22	501166	Transformer - 2nd I.F.
23	501233	Transformer - 1st I.F.
24	R-500916	Speaker - dynamic (4")
25	R-501163	Transformer - output for R-500916 Spkr.
26	R-501164	Cone & Voice Coil for R-500916 Spkr.
27A-27B	501213	Electrolytic Condenser (A-40 mfd. - 150 volt) (B-20 mfd. - 150 volt)

MODEL S-7402-8

ALIGNMENT PROCEDURE

1. Connect output meter across voice coil or from 50L6GT plate through a .1 mfd. condenser to chassis.
2. Set Volume Control in maximum position.
3. Connect signal generator ground through a .1 mfd. condenser to chassis.
4. Set dial pointer to 160 with slugs all the way out.

Dummy Ant. in Series with Sig. Gen.	Connection Sig. Gen. Output to Receiver	Sig. Gen. Freq.	Receiver Dial Setting	Trimmer No.	Trimmer Description	Type of Adjustment
200 Mmfd. Mica Condenser	Grid of 12SA7 Tube	455 KC	Any place where it does not affect signal	1-2 3-4	2nd I.F. 1st I.F.	Adjust screws on top of I.F. cans for maximum output
200 Mmfd. Mica Condenser	Antenna Terminal	1600 KC	1600 KC	5	B.C. Osc.	Adjust for maximum output
200 Mmfd. Mica Condenser	Antenna Terminal	1600 KC	Tune to 1600 KC Gen. Sig.	6	B.C. Ant.	Adjust for maximum output
200 Mmfd. Mica Condenser	Antenna Terminal	1400 KC	Tune to 1400 KC Gen. Signal	7	B.C. Ant. Coil	Adjust moveable Antenna Coil for maximum output



NOTE: After completing adjustment No. 7 return slugs to maximum out position and check trimmer No. 6. If no appreciable change in trimmer adjustment is necessary for maximum output, the antenna circuit is tracking. If the trimmer No. 6 requires considerable change it will be necessary to repeat adjustment No. 7 again. These two adjustments (Nos. 6 & 7) should be made several times until no change in trimmer adjustment for maximum output is necessary at either point.

TO RESTRING TUNING MECHANISM

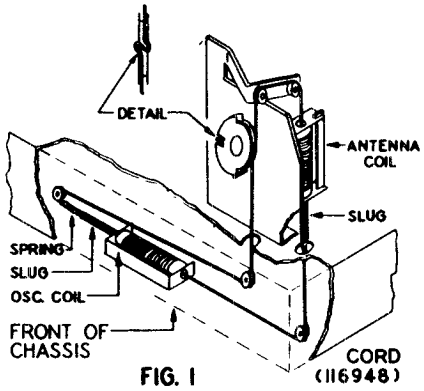


FIG. 1

1. Form a loop in one end of the cord and attach it to the hook nearest to the dot on the slug marked with a yellow dot. Form another loop through the hook farthest from the dot on the slug with the white dot and adjust the length so that the distance from the iron end of one slug to the iron end of the other is 2 15/16 inches.
2. Attach another length of cord to the other end of the yellow dot slug and drop the assembly through the hole in the top of the antenna coil leaving the newly added length of cord on the top end.
3. Pass the lower slug through the hole in the chassis, around the lower pulley and through the oscillator coil.
4. Now pass the cord from the top end over the two pulleys at the top of the mounting bracket, around the rear side of the small irregularly shaped pulley (see Fig. 1) threading it through the slots as shown in the "Detail" drawing and across the front down through the second hole in the chassis. Pass the cord under the upper pulley and around the top of the left hand pulley.
5. Form a loop and attach to spring (part no. 501145). Attach spring to slug in oscillator coil and adjust loop in cord to give normal tension.
6. The iron slug in the oscillator coil should project $1\frac{1}{32}$" from the end of the coil when the drive pulley is in its maximum counter-clockwise position. This may be adjusted by sliding the cord in the slots shown in the "Detail" drawing.
7. If the procedure outlined in the steps above has been carefully followed, the colored dot ends of the slugs will enter the coil last when the slugs are fully entered in the coils.
8. After restringing tuning mechanism, perform the alignment indicated under " Alignment Procedure " above.

DRUM SHOWN WITH SLUGS IN FULL OUT POSITION

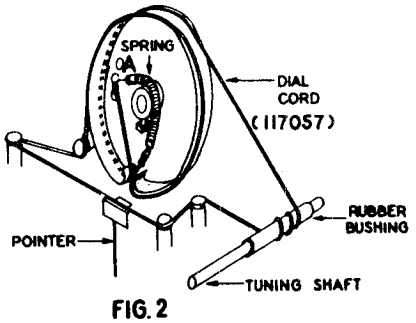

FIG. 2

TO RESTRING DIAL CORD

1. Set drum to position shown in Figure 2 with slugs in full out position (shown in Fig. 1).
2. Attach one end of the dial cord to point A on the drum.
3. Pass the cord through the opening at the bottom of the drum around the rear of the left side over the top and make two and one half turns around the rubber bushing on the tuning shaft as shown in Fig. 2.
4. Pass the cord around the guides as shown and over the front edge of the drum around and up through the opening at the bottom of the drum.
5. Attach spring to point A and bring it over hub of drum.
6. Form a loop in the cord and adjust for normal tension on the spring. (See Fig. 2).
7. Set the pointer to 1600 KC on the dial scale with the drum in the maximum counter-clockwise position.

FREQUENCY RANGES:

Standard Broadcast Band	540-1725 KC.
Intermediate Band	1.8-5.8 MC.
Short Wave Band	5.8-15.5 MC.
16-13 Meter Spread Band	17.1-22.2 MC.
19 Meter Spread Band	14.5-17.1 MC.
25 Meter Spread Band	11.17-12.2 MC.
31 Meter Spread Band	9.28-9.8 MC.

TUBE COMPLEMENT:

6SK7—R.F. Amplifier
6K8—Oscillator—1st Detector
6SK7—I.F. Amplifier
6SQ7—2nd Detector—A.V.C.—Phase Inverter
6SQ7—1st Audio
6K6GT } Power Output
6K6GT } (Push-pull)
5Y3GT—Rectifier

POWER OUTPUT:

Undistorted—4.5 watts
Maximum—7.0 watts

I.F. FREQUENCY:

455 KC.

SPEAKER:

8 inch P.M. Dynamic
Voice coil impedance—4.4 ohms

POWER SUPPLY:

110, 125, 150, 200, 225 or 245 volts
50-60 cycles A.C.
70 watts (at 125 volts)

TUNING CONDENSER:

3 section gang;
Double rotor, Double stator;
shock resistant mounting

AUDIO OSCILLATION

The audio system of this receiver utilizes a two stage type of inverse feed-back arrangement and should it ever be necessary to replace the speaker or output transformer it is important to maintain a definite phase relationship in the feed-back circuit. If the connections to the output transformer are reversed or if the feed-back connection is made to the wrong side of the output transformer secondary, the system will become regenerative instead of degenerative. Under those conditions audio oscillation may result. If that occurs, oscillation may be prevented by reversing the connections to the primary of the output transformer.

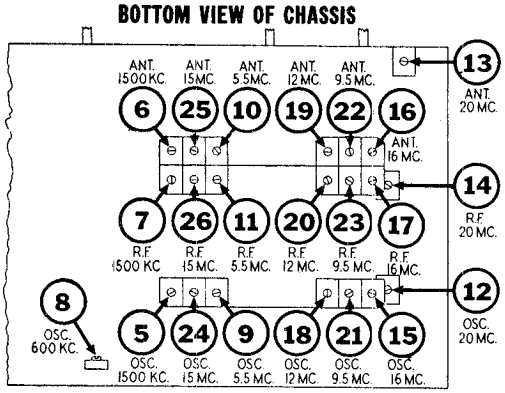
BOTTOM VIEW OF CHASSIS

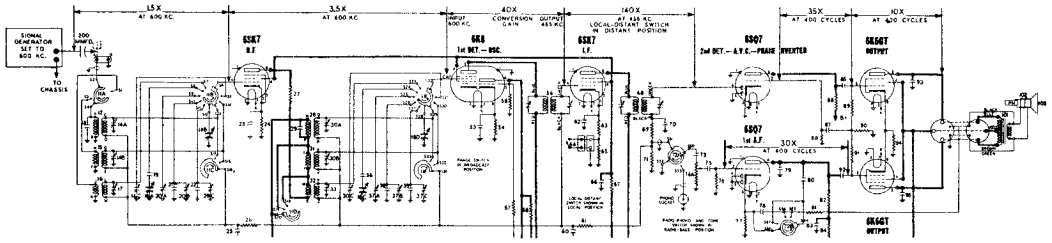


STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given above.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 3 volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 3 volt battery to A.V.C. at the black lead of the 1st I.F. transformer and connect the positive battery lead to the receiver chassis.
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument, carefully tune it for maximum output at desired frequency before making measurements.



DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

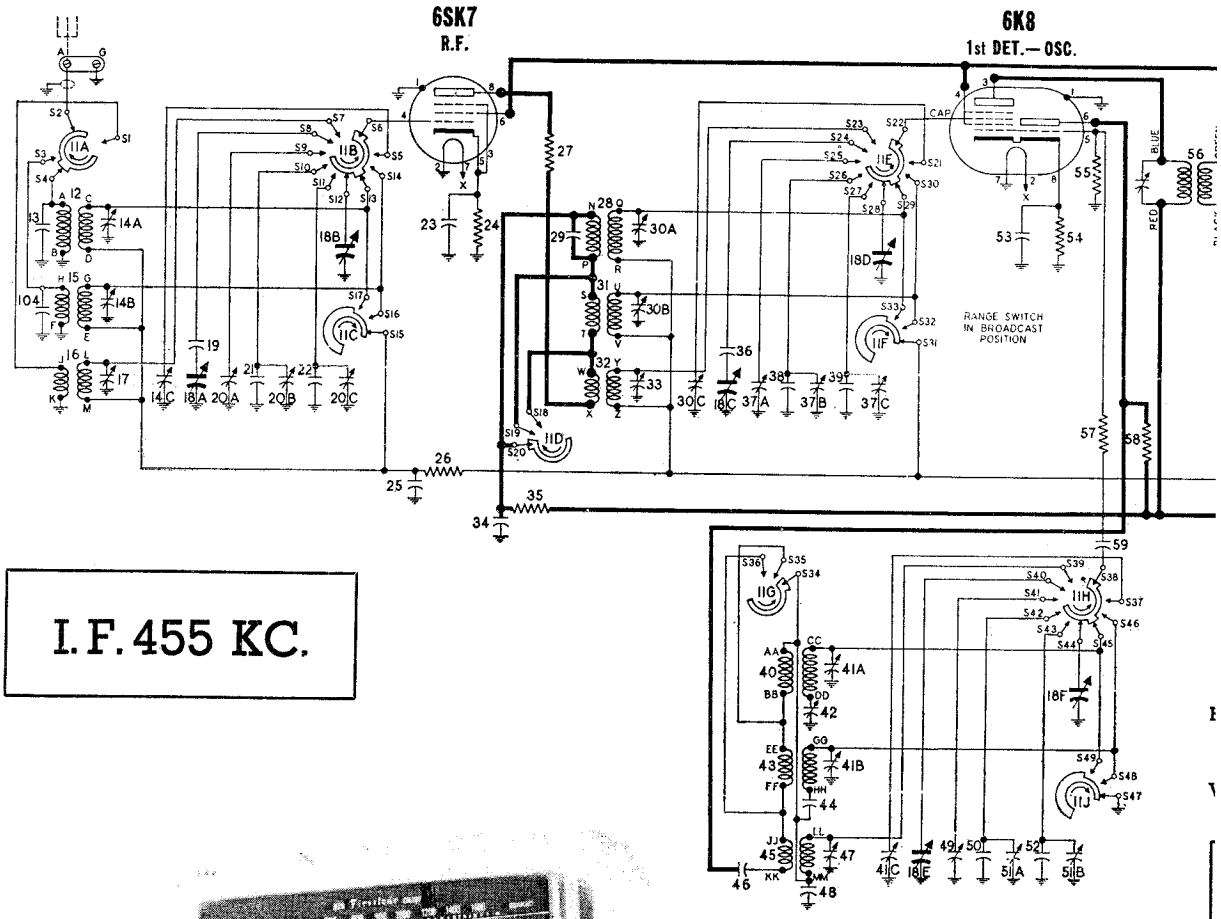
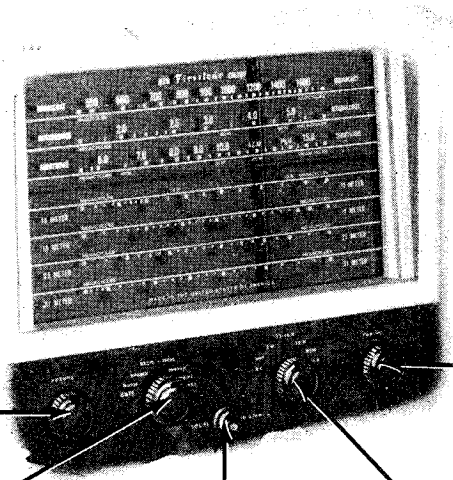
Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagr



I.F. 455 KC.



ON-OFF SWITCH AND VOLUME CONTROL

Turn this knob clockwise to turn set on. Continuing clockwise will increase volume.

MARCHA — VOLUMEN

Para usar el radio voltée esta perilla a la derecha y luego para aumentar el volumen hágalo a la izquierda.

TUNING CONTROL

Use this control to tune receiver to the desired station.

SINTONIZACION

Voltée esta perilla a la derecha o izquierda hasta dar con la estación deseada.

TONE AND RADIO-PHONO SWITCH

Use to select most pleasing tone and also to switch from radio to phonograph operation when using a separate record player. Starting at extreme counter-clockwise setting and turning clockwise, first 3 positions are for radio and next 3 are for phono.

CAMBIADOR DE TONO Y RADIO-FONO

Use éste para escoger el tono más agradable y también para el fonógrafo cuando se hace uso de un tocador de discos separado. Empezando al extremo derecho voltée a la izquierda y luego a la derecha parando según convenga. Las tres primeras posiciones son para el radio y las tres siguientes para el fonógrafo.

LOCAL-DISTANT SWITCH

Use the "DISTANT" position when tuning for weak stations. The "LOCAL" position is used to reduce inter-station noise when tuning for strong stations.

CAMBIADOR DE POSICIONES

Use la posición DISTANT para sintonizar estaciones débiles o de poca potencia y la posición LOCAL para reducir ruidos producidos por estaciones debiles que están entre estaciones de mayor potencia.

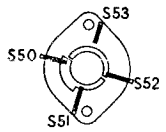
BAND SWITCH

Use to select desired tuning range. Title of each position corresponds with marking at side of dial scale for that range.

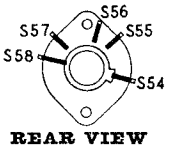
CAMBIADOR DE BANDA

Use éste para sintonizar teniendo en cuenta que cada posición está rotulada para corresponder con la rotulación al lado de la escala para tal banda o alcance.

RADIO-PHONO & TONE SWITCH 502719



FRONT VIEW



REAR VIEW

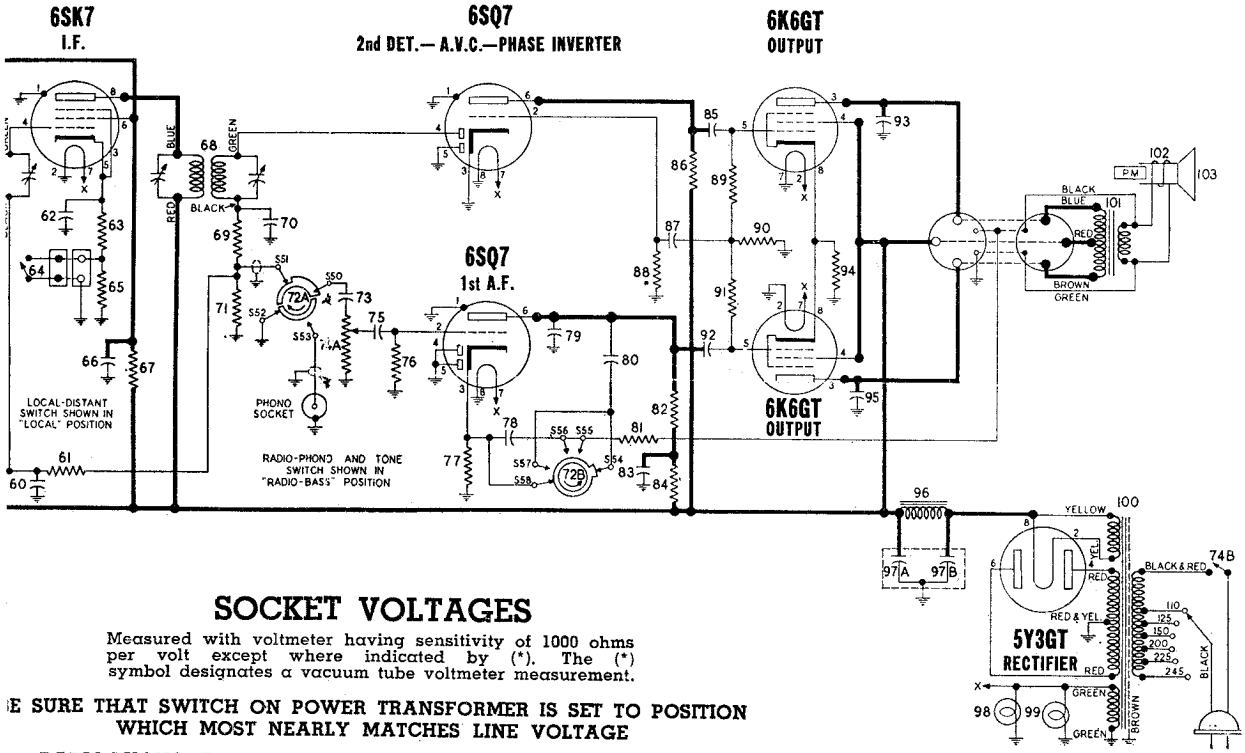
DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

113177 Tension Spring
114955 Clip on end of cord
119087 Ring
502773 Cord (8 feet)
4½ ft. for pointer drive
3½ ft. for tuning drive



SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

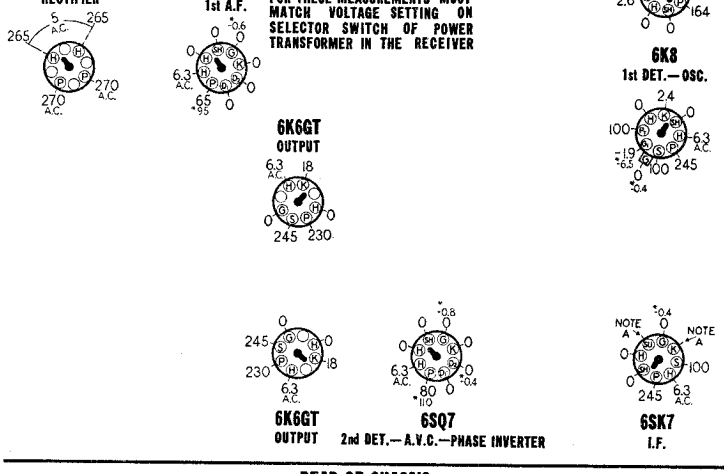
E SURE THAT SWITCH ON POWER TRANSFORMER IS SET TO POSITION WHICH MOST NEARLY MATCHES LINE VOLTAGE

RADIO-PHONO AND TONE SWITCH IN "RADIO-BASS" POSITION
OLUME ON FULL WITH NO SIGNAL DIAL TUNED TO 540 KC
BAND SWITCH IN BROADCAST POSITION

BOTTOM VIEW OF CHASSIS

ALL VOLTAGES MEASURED BETWEEN SOCKET TERMINALS AND CHASSIS.

VOLTAGE OF POWER SUPPLY USED FOR THESE MEASUREMENTS MUST MATCH VOLTAGE SETTING ON SELECTOR SWITCH OF POWER TRANSFORMER IN THE RECEIVER



REAR OF CHASSIS

OTE A: The voltage at the cathode or suppressor terminals of this tube is 13 olts when Local-Distant switch is in "Local" position and 2.4 volts when vitch is set to "Distant" position.

* Not used; may serve as wiring junction point.

ALIGNMENT PROCEDURE

1. When gang condenser is fully meshed, dial pointer should be in the position indicated by the last division below 550 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
2. Connect an output meter across the speaker voice coil or from the plate of the 6K6GT tube to chassis through a 0.1 Mfd. condenser.
3. Connect the ground lead of the signal generator to the receiver chassis.
4. Set volume control to maximum volume position and use a weak signal from the signal generator.
5. Set Radio-Phono and Tone switch to "Radio-Bass" position.
6. Set Local-Distant switch to "Distant" position.

IMPORTANT: Align this receiver in exactly the order shown below. The 13-16 Meter band must be aligned before any of the other short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Cap of 6K8	455 KC	Broadcast (*Position 1)	Any point where it does not affect the signal.	1-2	2nd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	1st I.F.	
200 MMFD. Mica Condenser	"A" terminal at rear of chassis.	1500 KC	Broadcast (*Position 1)	1500 Kc.	5	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	"A" terminal at rear of chassis.	1500 KC	Broadcast (*Position 1)	Tune to 1500 Kc. generator signal.	6	Broadcast Antenna	Adjust for maximum output.
					7	Broadcast R.F.	
200 MMFD. Mica Condenser	"A" terminal at rear of chassis.	600 KC	Broadcast (*Position 1)	Tune to 600 Kc. generator signal.	8	Broadcast Oscillator (Series Pad)	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
200 MMFD. Mica Condenser	"A" terminal at rear of chassis.	Repeat adjustment of trimmers 5, 6, and 7 at 1500 Kc. Then re-check adjustment of trimmer 8 at 600 Kc.					
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	5.5 MC	Intermediate (*Position 2)	5.5 Mc.	9	Intermediate Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 4.6 MC. If image does not appear, realign at 5.5 MC, with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	"A" terminal at rear of chassis.	5.5 MC	Intermediate (*Position 2)	Tune to 5.5 Mc. generator signal.	10	Intermediate Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

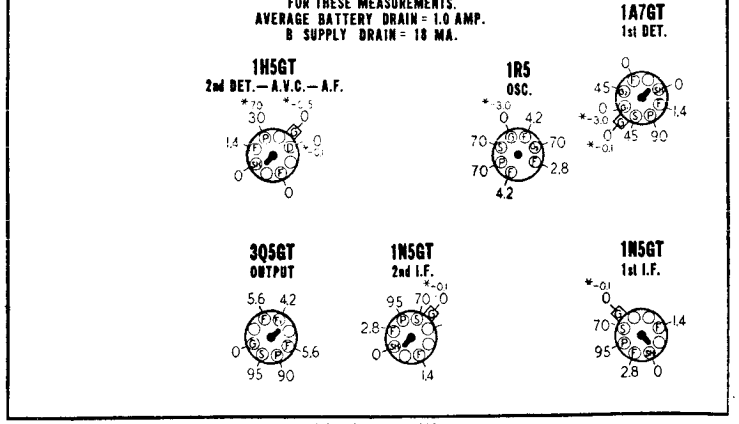
I.F. 455 K.C.

VOLUME ON FULL WITH NO SIGNAL — DIAL TUNED TO 540 KC
BAND SWITCH IN BROADCAST POSITION

BOTTOM VIEW OF CHASSIS

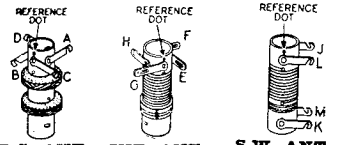
ALL VOLTAGES MEASURED BETWEEN SOCKET TERMINALS AND CHASSIS.
6 VOLT BATTERY USED FOR THESE MEASUREMENTS.
AVERAGE BATTERY DRAIN = 1.0 AMP.
B SUPPLY DRAIN = 18 MA.



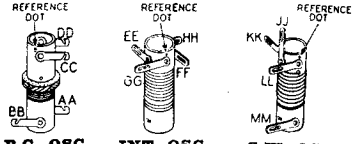
REAR OF CHASSIS

SOCKET VOLTAGES

Measured with voltmeter having sensitivity of 1000 ohms per volt except where indicated by (*). The (*) symbol designates a vacuum tube voltmeter measurement.

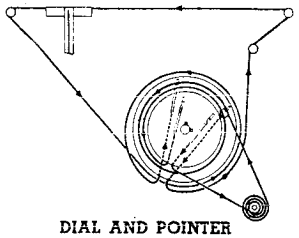


B.C. ANT. COIL 502872 — INT. ANT. COIL 502874 — S.W. ANT. COIL 502716



B.C. OSC. COIL 502873 — INT. OSC. COIL 502875 — S.W. OSC. COIL 502876

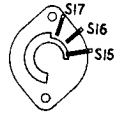
Lettered terminals in illustrations correspond to similarly lettered terminals on the circuit diagram.



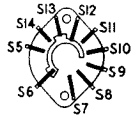
DIAL AND POINTER DRIVE CORD ARRANGEMENT

To string dial cord, set gang condenser to fully meshed position and use following parts:

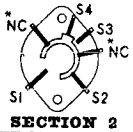
113177 Tension Spring
114955 Clip on end of cord
119087 Ring
502773 Cord (8 feet)
4½ ft. for pointer drive
3½ ft. for tuning drive



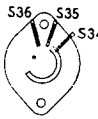
SECTION 1 FRONT VIEW



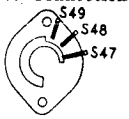
SECTION 1 REAR VIEW



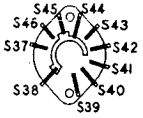
SECTION 2 FRONT VIEW
*No Connection



SECTION 3 REAR VIEW



SECTION 4 FRONT VIEW



SECTION 4 REAR VIEW

*Not used; may serve as wiring junction point.

BAND SWITCH 502855

ALIGNMENT PROCEDURE

1. When gang condenser is fully meshed, dial pointer should be in the position indicated by the last division below 550 on the dial. If it is set incorrectly, release pointer clip on dial cord and reposition pointer.
2. Connect an output meter across the speaker voice coil or from the plate of the 3Q5GT tube to chassis through a 0.1 Mfd. condenser.
3. Connect the ground lead of the signal generator to the receiver chassis.
4. Set volume control to maximum volume position and use a weak signal from the signal generator.

IMPORTANT: Align this receiver in exactly the order shown below. The 13-16 Meter band must be aligned before any of the other short wave bands.

DUMMY ANT. IN SERIES WITH SIGNAL GENERATOR	CONNECT HIGH SIDE OF SIGNAL GENERATOR TO	SIGNAL GENERATOR FREQUENCY	BAND SWITCH POSITION	RECEIVER DIAL SETTING	TRIMMER NUMBER	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT
200 MMFD. Mica Condenser	Cap of 1A7GT	455 KC	Broadcast (*Position 1)	Any point where it does not affect the signal.	1-2	3rd I.F.	Adjust for maximum output. Then repeat adjustment.
					3-4	2nd I.F.	
					5-6	1st I.F.	
200 MMFD. Mica Condenser	"ANT" terminal at rear of chassis.	1500 KC	Broadcast (*Position 1)	1500 Kc.	7	Broadcast Oscillator (Shunt)	Adjust for maximum output.
200 MMFD. Mica Condenser	"ANT" terminal at rear of chassis.	1500 KC	Broadcast (*Position 1)	Tune to 1500 Kc. generator signal.	8	Broadcast Antenna	Adjust for maximum output.
200 MMFD. Mica Condenser	"ANT" terminal at rear of chassis.	600 KC	Broadcast (*Position 1)	Tune to 600 Kc. generator signal.	9	Broadcast Oscillator (Series Pad)	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
200 MMFD. Mica Condenser	"ANT" terminal at rear of chassis.	Repeat adjustment of trimmers 7 and 8 at 1500 Kc Then recheck adjustment of trimmer 9 at 600 Kc.					
400 OHM Carbon Resistor	"ANT" terminal at rear of chassis.	5.5 MC	Intermediate (*Position 2)	5.5 Mc.	10	Intermediate Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 4.6 MC. If image does not appear, realign at 5.5 MC. with trimmer screw farther out. Recheck image.
400 OHM Carbon Resistor	"ANT" terminal at rear of chassis.	5.5 MC	Intermediate (*Position 2)	Tune to 5.5 Mc. generator signal.	11	Intermediate Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	"ANT" terminal at rear of chassis.	20 MC	13-16 Meter (*Position 4)	20 Mc.	12	13-16 Meter Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 20.9 MC. If image does not appear, realign at 20 MC. with trimmer screw in a different position. Recheck image.
400 OHM Carbon Resistor	"ANT" terminal at rear of chassis.	20 MC	13-16 Meter (*Position 4)	Tune to 20 Mc. generator signal.	13	13-16 Meter Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	"ANT" terminal at rear of chassis.	16 MC	19 Meter (*Position 5)	16 Mc.	14	19 Meter Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by tuning in image at approx. 16.9 MC. If image does not appear, realign at 16 MC. with trimmer screw in a different position. Recheck image.
400 OHM Carbon Resistor	"ANT" terminal at rear of chassis.	16 MC	19 Meter (*Position 5)	Tune to 16 Mc. generator signal.	15	19 Meter Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.
400 OHM Carbon Resistor	"ANT" terminal at rear of chassis.	12 MC	25 Meter (*Position 6)	12 Mc.	16	25 Meter Oscillator	Adjust for maximum output. Check to see if proper peak was obtained by setting the signal generator to 11.1 Mc. and then tune radio in vicinity of 12 Mc. If image signal is not heard, realign at 12 Mc. with trimmer screw further in. Recheck image.
400 OHM Carbon Resistor	"ANT" terminal at rear of chassis.	12 MC	25 Meter (*Position 6)	Tune to 12 Mc. generator signal.	17	25 Meter Antenna	Adjust for maximum output. Try to increase output by detuning trimmer and retuning receiver dial until maximum output is obtained.

*Position 1 corresponds to extreme counter-clockwise setting of band switch. Succeeding positions are numbered in ascending order as switch is rotated clockwise.

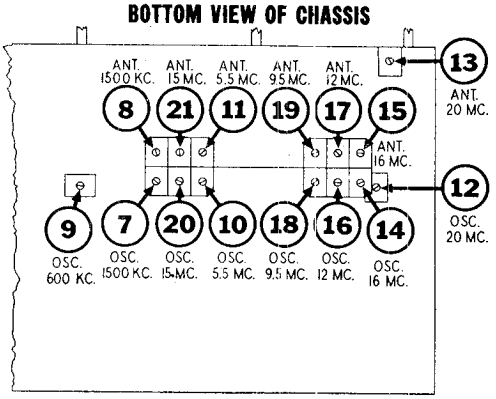
BOTTOM VIEW OF CHASSIS

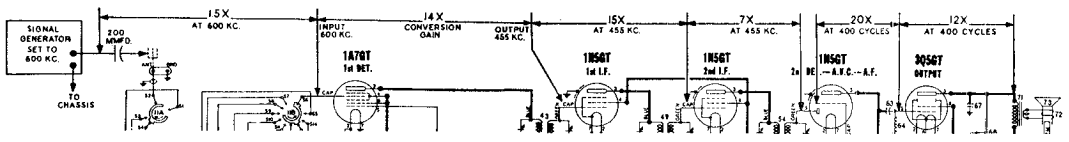


STAGE GAIN MEASUREMENT PROCEDURE

REQUIRED INSTRUMENTS: The amount of amplification or "gain" of each of the stages of this receiver may be measured with an A.C. Vacuum Tube Voltmeter or a "channel" type instrument containing a tuned and calibrated amplifier.

PROCEDURE: It is exceedingly important to adhere to the procedure outlined below since the accuracy of these measurements will be affected to a considerable extent by the failure to establish proper operating conditions.

1. Be sure that R.F. and I.F. stages are carefully and accurately aligned by utilizing the alignment procedure given above.
2. Connect Signal Generator as shown below.
3. The values of stage gain which are given here were measured with a fixed bias of 1½ volts on the control grids of all R.F. and I.F. tubes which are connected to the A.V.C. circuit. Therefore, these values are not intended to indicate the full capability of a stage but they will serve as a convenient basis for determining proper operation. In order to duplicate the fixed bias voltage, connect the negative terminal of a 1½ volt battery to A.V.C. at the white lead of the 2nd I.F. transformer and connect the positive battery lead to the receiver chassis.
4. Set Signal Generator for operation at 600 Kc with 400 cycle modulation and carefully tune radio receiver to this signal by using an output meter to indicate peak output. If a local station interferes, set generator to a nearby frequency and re-tune the receiver.
5. R.F. and I.F. circuits are slightly de-tuned when contact is made with an instrument probe and this action, which is indicated by a change in the output meter reading, may seriously affect the gain measurement. Therefore, it is important to adjust the associated circuit trimmer for a maximum output meter reading and to set the input signal level to a convenient reference point on the gain measuring instrument while the probe is making contact. After removing the probe it is again necessary to adjust the trimmer so as to obtain the same output meter reading and thereby assure that the signal voltage at the specified point has not changed as a result of circuit de-tuning.
6. When using a "channel" type instrument, carefully tune it for maximum output at desired frequency before making measurements.



DIFFERENCES in tube characteristics, tolerance of parts, adjustment of tuned circuits and variations in line voltage will influence stage gain. These factors should be given due attention in event the gain of a stage varies extensively from the values shown above.

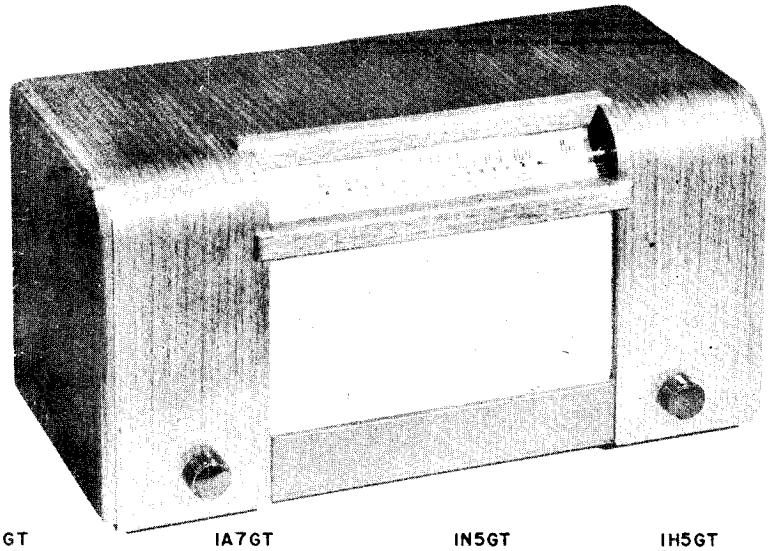
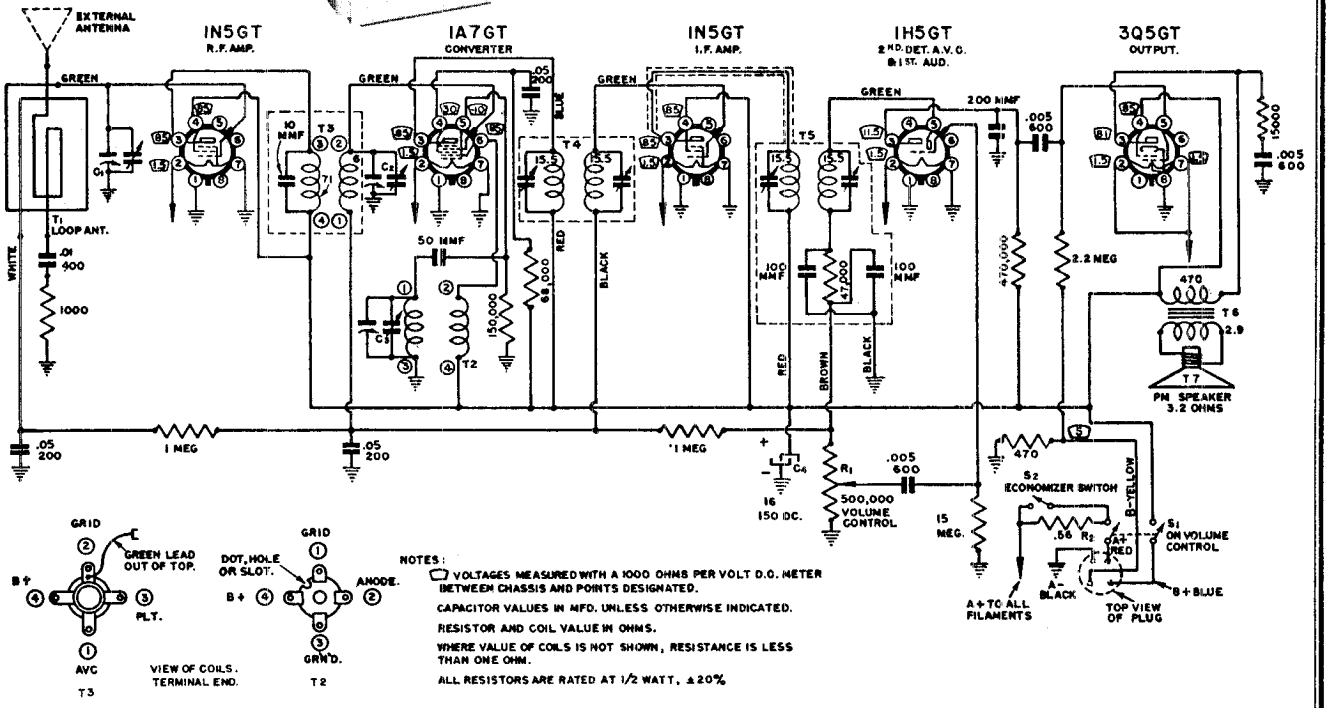
MODEL 43-6485





Note on "B" Models—Resistor - 68,000 Ohm in Screen Circuit of 1A7GT Tube, Replaced with 33,000 Ohm.

Voltage at Terminal #4 on 1A7GT Tube Increased to 48 (Average).

- Output meter across 3.2-ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.
- Loop antenna should be connected to receiver and in its proper position when making adjustments.

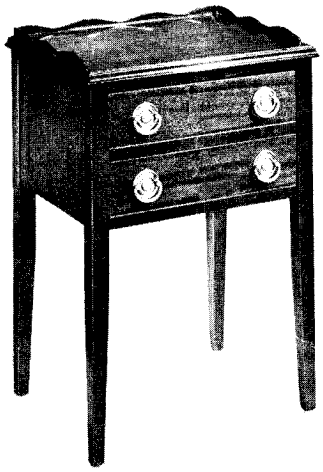
BATTERY INSTALLATION

REMOVAL OF CHASSIS—If it is found necessary for any reason to remove the radio chassis from the cabinet, proceed as follows: Remove knobs by pulling straight off, disconnect battery by removing plug, and remove two screws inserted through bottom of cabinet. Chassis can be removed now. (Note—After installing chassis in cabinet see that the bakelite strip attached to dial cord is engaged with the pin on the dial pointer.)

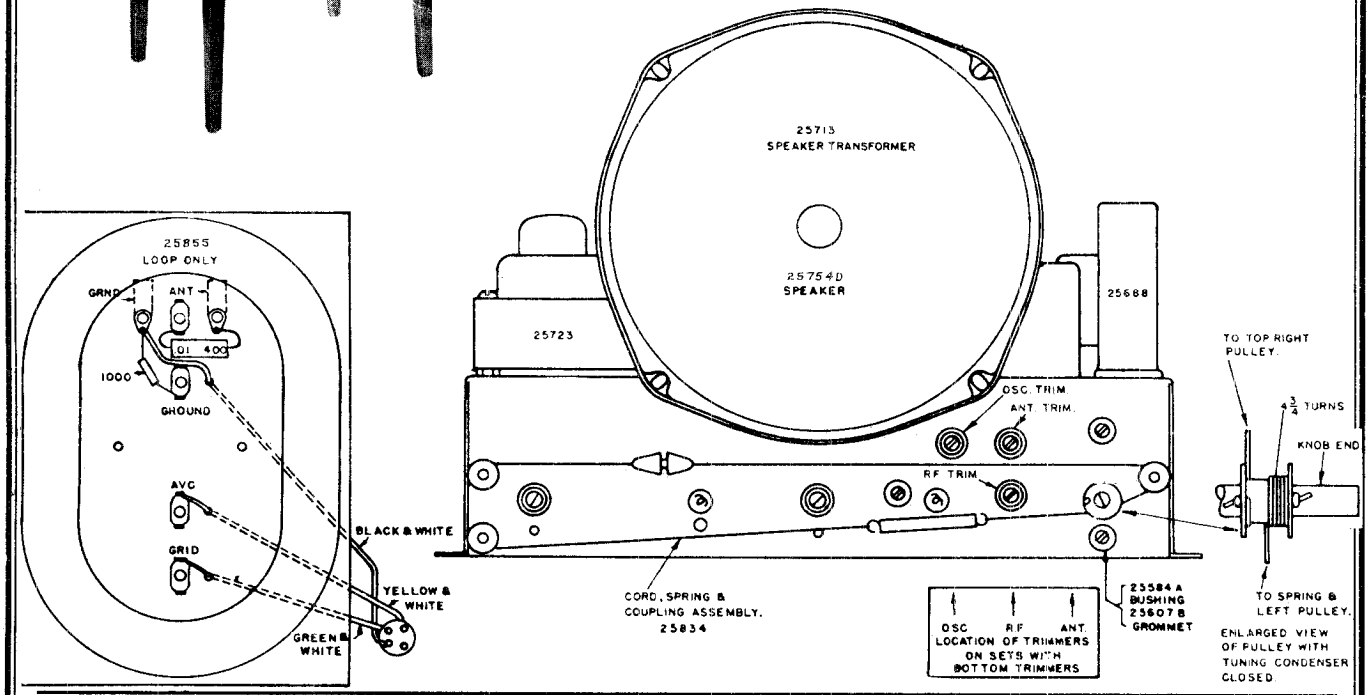
©John F. Rider

MODEL 43-6730



DIAL CORD REPLACEMENT—Is best accomplished by replacing complete cord assembly No. 25834 which is made up to correct length. In an emergency 30 lb. fish line may be used. See picture of chassis for correct installation.

DIAL SCALE REPLACEMENT—Remove chassis. Remove pointer track by removing the two wood screws holding it to the cabinet. Dial scale may now be lifted out from front of cabinet. When installing new scale —see that long screws in track bracket engage the notches in the ends of the scale.



ALIGNMENT PROCEDURE

Volume control at maximum volume and output from signal generator no higher than is necessary to obtain output reading. Use insulated alignment screw driver for adjusting.

DUMMY ANT.	SIGNAL GENERATOR COUPLING	SIGNAL GENERATOR FREQUENCY	RADIO DIAL SETTING	OUTPUT METER	ADJUST	REMARKS
.1 mfd	High side to top (grid) cap 1A7. Low side to chassis.	455 kc.	High freq. and tuning gang at minimum capacity	Across voice coil	T5 output I.F., T4 input I.F.	Adjust for maximum output
.0001 mfd	High side to ant. wire (green). Low side to chassis.	1620 kc.	High freq. and tuning gang at minimum capacity	Across voice coil	C3, Osc. Trim	Adjust for maximum output
.0001 mfd	High side to ant. wire (green). Low side to chassis.	1400 kc.	Tune in 1400 kc. signal.	Across voice coil	C1, C2 Ant. Trim and R.F. Trim	Adjust for maximum output

MODEL 43-7660B

ALIGNMENT PROCEDURE

FM Band Section I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT— No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE— The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM-I.F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENT TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 No. 3 and ground	See note "A"	Secondary of T5	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T4A 10.7 m.c. windings See I.F. view	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3A See I.F. view	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM-R.F. ALIGNMENT

Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.
For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R. F. C56 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

©John F. Rider

MODEL 43-7660B

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.

A M - I. F. A L I G N M E N T

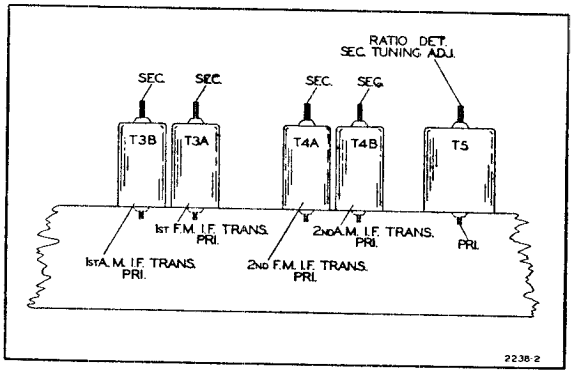
Band Switch in AM Position. Tune Set to 1400 *Kc. Dummy Antenna* .1 *Mfd.*

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4B AM windings See I. F. view	Maximum output Should be ½ watt.
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3B AM windings See I. F. view	Maximum output Should be ½ watt.
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt.

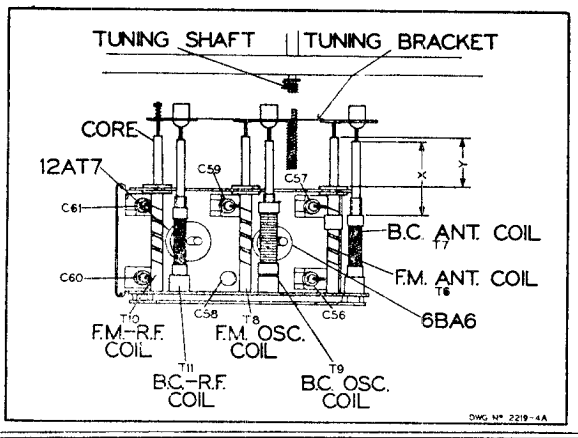
B R O A D C A S T B A N D - R. F. A L I G N M E N T

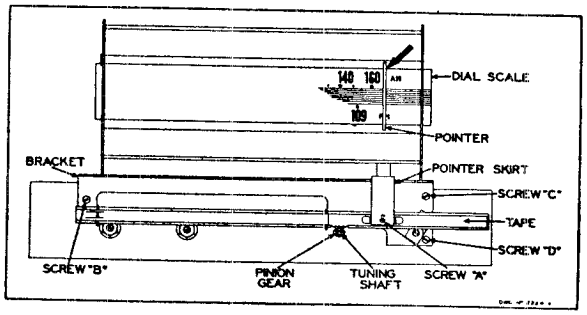
Check pointer so that it coincides with the right hand marker to the extreme right when iron cores are all the way out.
For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQ.	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C59, C57, C61. For maximum, ½ watt



I. F. VIEW





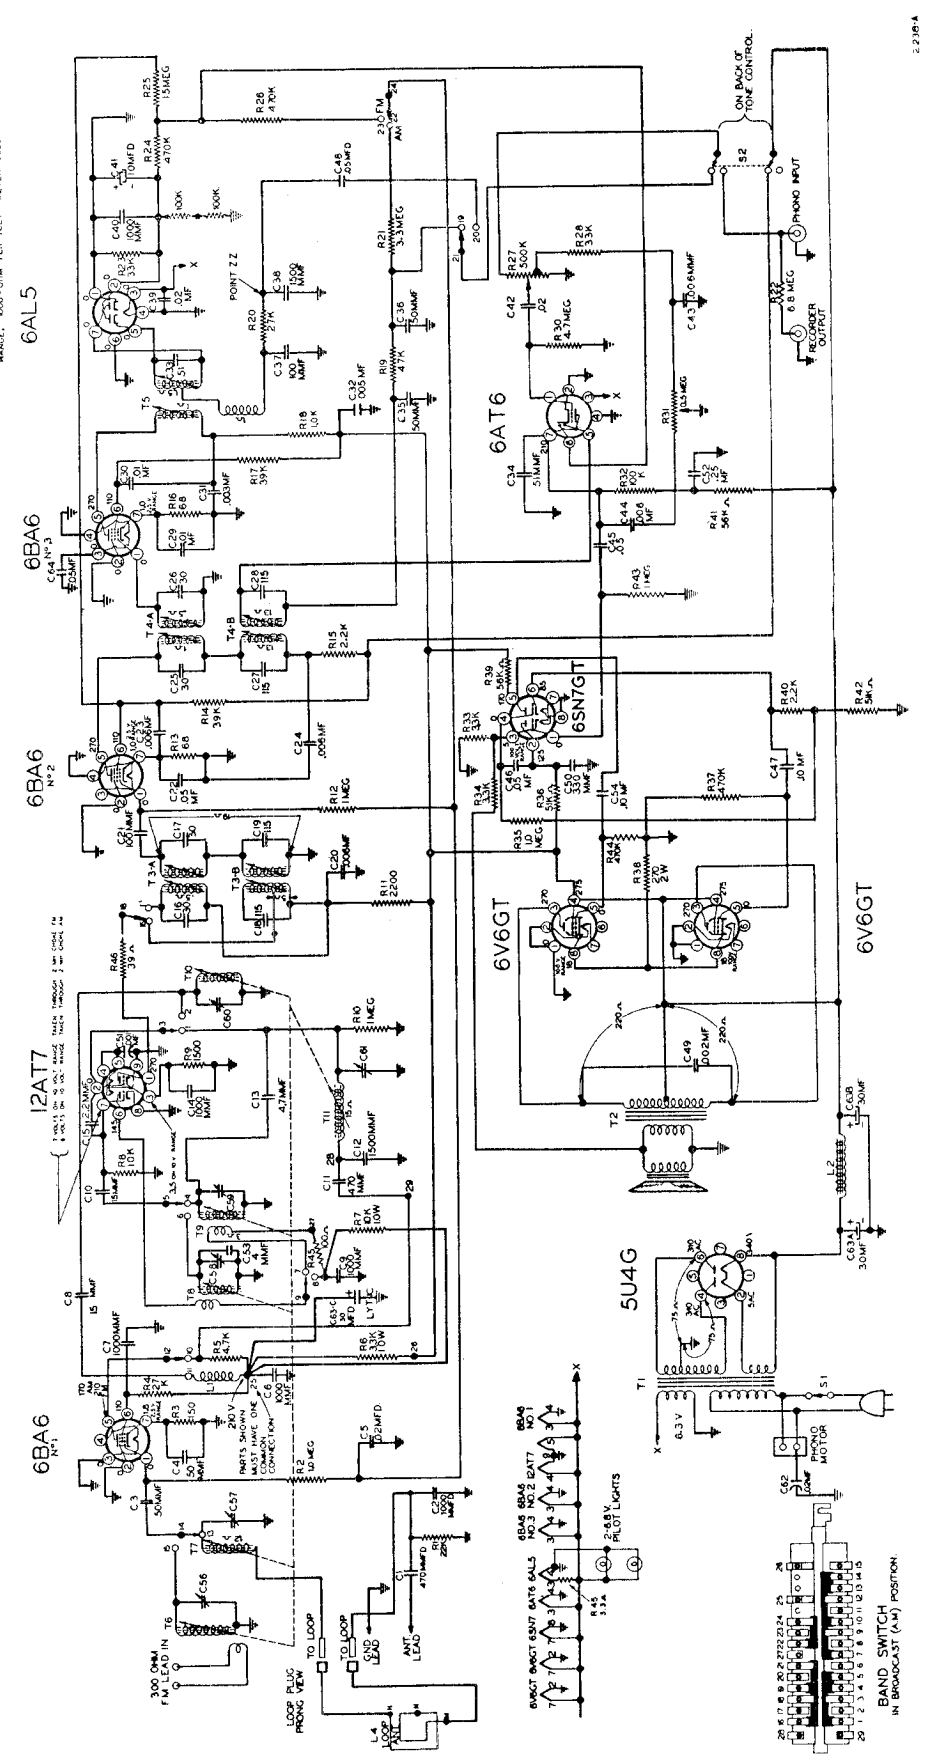
Loosen screws "C" and "D" so that teeth of tape can be properly meshed with pinion gear to give proper pointer travel.

TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/32 inches. "X" is from the end of the slug to edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM Band. No slug adjustment should be necessary since the slugs are properly set at the factory.

©John F. Rider

MODEL 43-7660B



NOTE: Two 100K ohm resistors in series from Pin No. 2 of the 6AL5 to ground are connected as shown only when aligning the FM I. F. Refer to FM I. F. alignment procedure.

NOTE: Some sets used 250 ohm—5 watt resistor for R38.

RECORD CHANGER: See Webster Model 50, Page RCD.CH. 15-1 through RCD.CH. 15-9

GENERAL DESCRIPTION

This is a two band, six tube (plus rectifier tube) receiver for the reception of both AM and FM stations. The I-F stages use the latest type high gain miniature type tubes and built-in Aerials are provided for the FM and Broadcast bands. Features include, compensator circuits to prevent oscillator drift, automatic volume control, beam power output stage, PM dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.

The receiver is housed in a console cabinet with controls provided for tuning, volume, tone and band or phono selection.

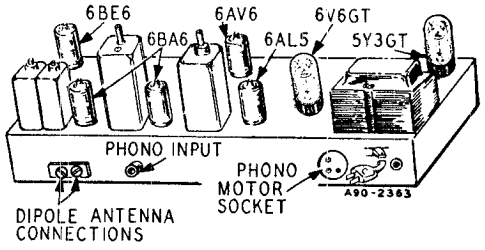
1 6BA6 1st I-F Amplifier
1 6BA6 2nd I-F Amplifier
1 6AL5 FM Discriminator
1 6AV6 Audio Amplifier, AM 2nd Detector and AVC
1 6V6GT Audio Output
1 5Y3GT Rectifier
2 No. 47 Dial Lamps



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.

MODEL 94RA1-43-6945A

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. C-14 and C-15	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-39	Maximum Output
1400 KC	External Antenna Lead	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-35	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor — .01 mf, 300 ohms and 100K ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).

Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.

Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K. ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator adjustments.

NOTE E—2nd I-F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

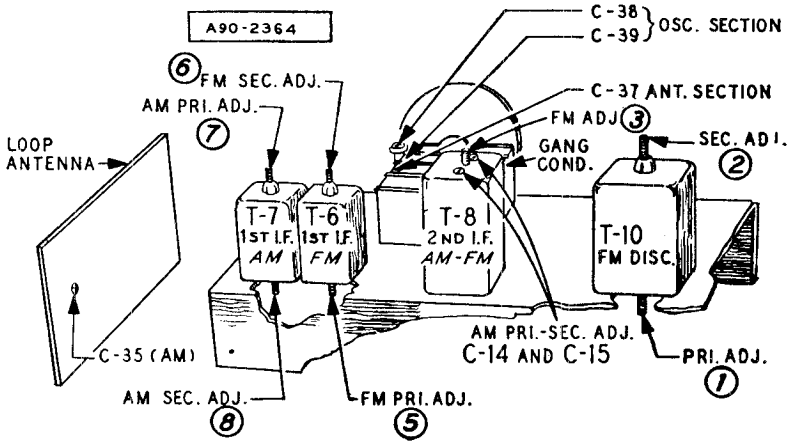
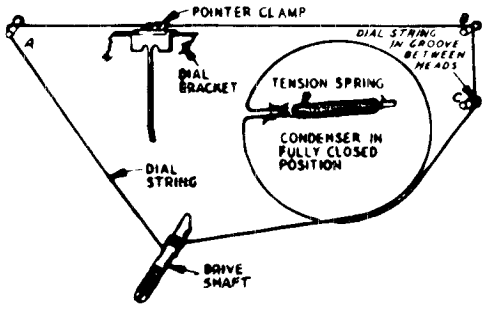
MODEL 94RA1-43-6945A





DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X38 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts AC 50-60 cycles, 60 watts.
Frequency Ranges	Broadcast 540-1600 KC Frequency Modulation 88-108 MC
Intermediate Frequency	AM—455KC FM—10.7 MC
Selectivity	AM—45 KC broad at 1000 times signal, measured at 1000 KC I.F. FM—200 KC broad at 2 times down I.F. FM—950 KC broad at 200 times down
AM Sensitivity	(For .5 watt output with external antenna) 10 microvolts average
FM Sensitivity	(For .5 watt output) 100 microvolts average
Power Output	4.5 watts maximum 2.5 watts 10% distortion
Loud Speaker	10" PM Dynamic
Voice Coil Impedance	3.2 ohms 400 cycles

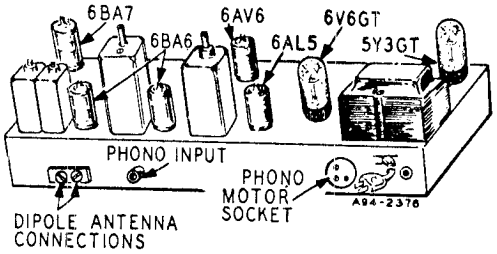
GENERAL DESCRIPTION

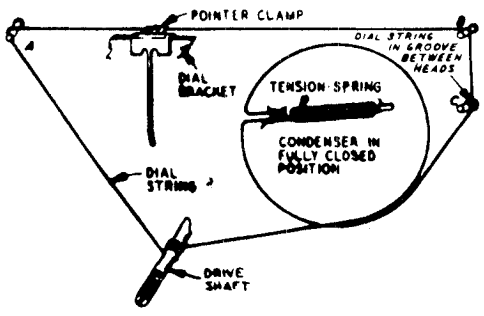
This is a two band, six tube (plus rectifier tube) receiver for the reception of both AM and FM stations. The I-F stages use the latest type high gain miniature type tubes and built-in Aerials are provided for the FM and Broadcast bands. Features include, compensator circuits to prevent oscillator drift, automatic volume control, beam power output stage, PM dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.

The receiver is housed in a console cabinet with controls provided for tuning, volume, tone and band or phono selection.

Tube and Dial Lamp Complement

1 6BA7 FM-AM Converter
1 6BA6 1st I-F Amplifier
1 6BA6 2nd I-F Amplifier
1 6AL5 FM Discriminator
1 6AV6 Audio Amplifier, AM 2nd Detector and AVC
1 6V6GT Audio Output
1 5Y3GT Rectifier
2 No. 47 Dial Lamps





DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X38 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shatt with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.
Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

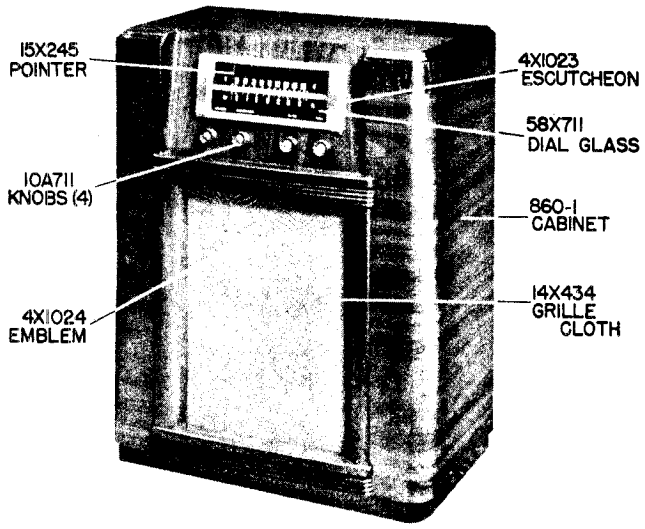
MODEL 94RA1-43-7605A



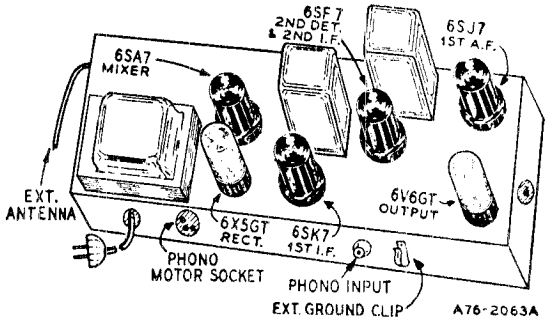
GENERAL DESCRIPTION

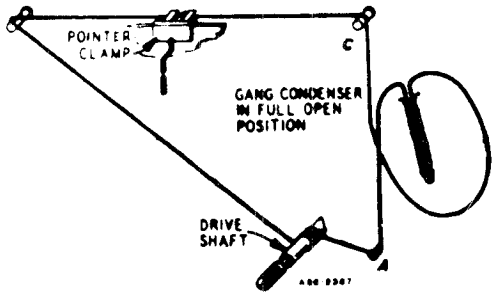
This model is a five tube (plus rectifier tube) AC console receiver with automatic record changer. Controls are provided for tuning, volume, tone, and band selection. The dial scale is calibrated in two bands, the broadcast band in channel numbers to cover frequencies between 540-1600 KC and the short wave band directly in megacycles from 5.75 to 18.3 MC. Other features include a built-in loop antenna, automatic volume control, beam power audio output stage and a PM dynamic speaker. A switch is provided on the tone control for selection of either radio or phono operation.

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts AC, 60 cycles, 45 watts. (65 watts phono operating)
Frequency Range	B range—540-1600 KC D range—5.75 to 18.3 MC
Intermediate Frequency	455 KC
Selectivity	40 KC broad at 1000 times signal, 1000 KC
Sensitivity	(for .5 watt output) with external antenna B range—9 microvolts average D range—20 microvolts average
Power Output	4 watts maximum 2.3 watts, 10% distortion
Loud Speaker	10" PM dynamic
Voice Coil Impedance	3.2 ohms at 400 cycles
Record Changer	VM-800 RECORD CHANGER*
Tube and Dial Light Complement	1 6SA7 Mixer 1 6SK7 1st I-F Amplifier 1 6SF7 2nd I-F Amplifier & 2nd Det. 1 6SJ7 1st A-F Amplifier 1 6V6GT Power Output 1 6X5GT Rectifier 2 No. 47 Dial Lamps

* See Manual No. 619-5 under Phonographs for parts.





DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully open position. Use a new 10X53 drive cord assembly or a piece of cord 48 inches long and tie one end to the tension spring. Hook the other end of the tension spring to the tab on the drive pulley. Pass the cord through the slot in the drive pulley rim around idler stud A and wind three and one-half turns clockwise around the tuning shaft (turns must progress away from chassis). Then pass cord over idler studs B and C. Wrap cord counterclockwise around drive pulley, stretch tension spring and fasten free end of cord to spring.

MODEL 94RA1-43-7605A

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for several minutes.

The following equipment is required for aligning:
An All Wave Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antennas—.1 mf., 50 mmf., and 400 ohms.

	SIGNAL GENERATOR		Dummy Antenna	Band Switch Setting	CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM
	Frequency Setting	Connection at Radio				
I-F	455 kc	6SA7, Pin 8	.1 mf	B Range	Turn Rotor to Full Open	2nd I-F (C-20) & (C-21) 1st I-F (C-15) & (C-16)
RANGE B	1620 kc	Antenna Lead	50 mmf	B Range	Turn Rotor to Full Open	Oscillator Range B (C9)
	1400 kc	Antenna Lead	50 mmf	B Range	Tune Rotor to Max. Output. Set Indicator to 1400 KC. See Note A	Antenna Range B (C3)
	600 kc	Antenna Lead	50 mmf	B Range	Tune Rotor to Max. Output	600 kc (C8) Rock Rotor—See Note B
Repeat above oscillator adjustments at 1620 and 600 KC until readjusting the oscillator Range B Trimmer (C9) causes no further improvement in output.						
RANGE D	18.3 mc	Antenna Lead	400 Ohm	D Range	Turn Rotor to Full Open	Oscillator Range D (C10)
	16 mc	Antenna Lead	400 Ohm	D Range	Tune Rotor to Max. Output	Antenna Range D (C2) Rock Rotor—See Note B
LOOP RANGE B	Reassemble chassis in cabinet. 1400 kc	Antenna Lead	50 mmf	B Range	Tune Rotor to Max. Output	Antenna Range B (C3)

After each range is completed, repeat the procedure as a final check.

NOTE A—If the pointer is not at 1400 KC on the dial, re-set pointer at the 1400 KC mark on the dial scale.

NOTE B—Turn the rotor back and forth and adjust the trimmer until the peak of greatest intensity is obtained.

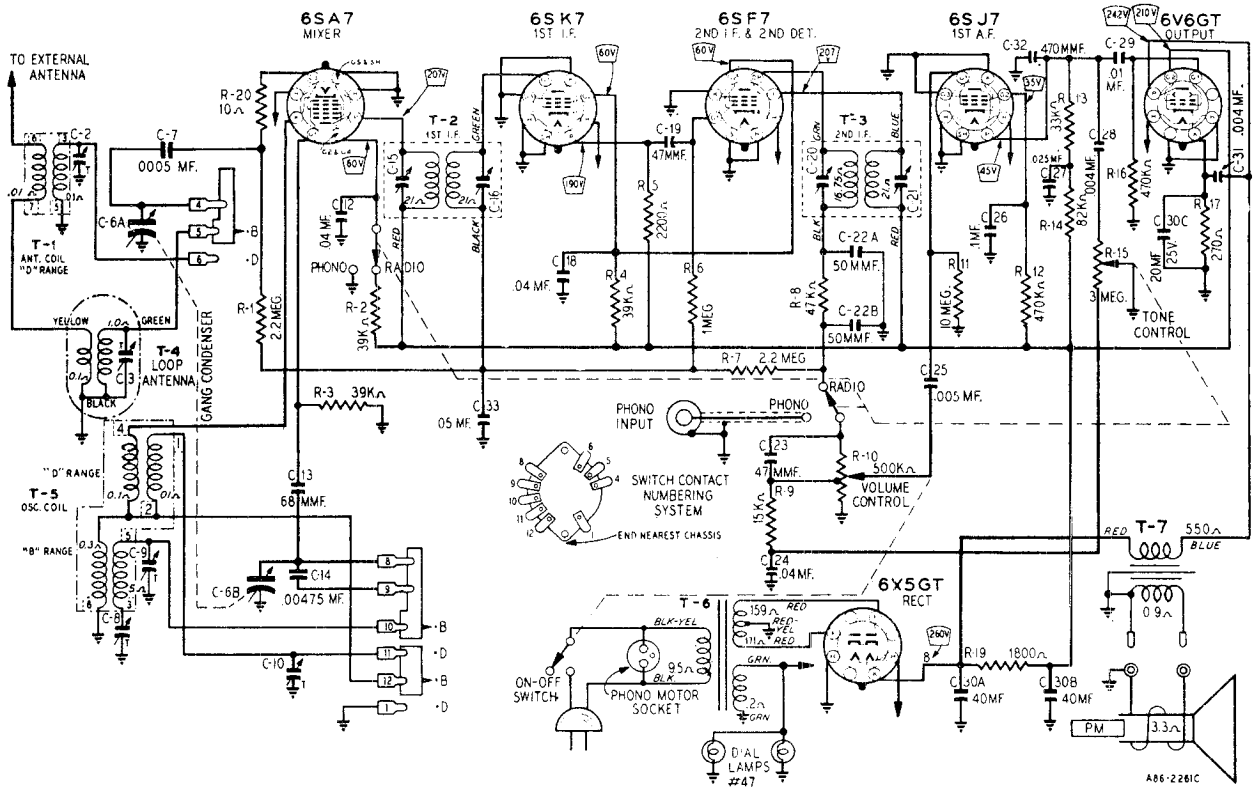
MODEL 94RA1-43-7605A



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground.

The readings were taken with a 1000 ohm per volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

A variation of +10% is usually permissible.

DRIVE CORD REPLACEMENT

Use a new 10X38 drive cord assembly or a new length of cord 46 inches long for the installation, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation, rotate the drive shaft a few turns to take up the slack in the cord.

ALIGNMENT PROCEDURE

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas —.1 mf, 200 mmf.
Volume Control—Maximum all Adjustments
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

Broadcast	1620 kc	External ant. lead	200 mmf	Broadcast	Rotor Fully Open	Broadcast Oscillator C-33	
	1400 kc	External ant. lead	200 mmf	Broadcast	Turn Rotor to Max. Output	Broadcast Interstage C-29	
	1400 kc	External ant. lead	200 mmf	Broadcast	Set pointer to 1400 kc See Note A	Loop Antenna C-48	

Note A—If the pointer is not at 1400 KC on dial, reset pointer at the 1400 KC mark on the dial scale.

FM STAGES

The following equipment is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 1000 ohms.
Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)
Allow chassis and signal generator to warm up for several minutes.

Recheck R-F and Osc. Adjustments in order given							

NOTE A—Test Equipment connections are as given in the table. The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line at the junction of resistor R-22 and condenser C-18 for all adjustments except the discriminator secondary adjustment, for which See Note C.

NOTE B—A signal of .1 volt must be fed into the receiver for this adjustment.

NOTE C—Disconnect zero center DC vacuum tube voltmeter from AVC and connect to junction of R-18 and C-62. Adjust for zero voltage indication.

NOTE D—Before adjusting Pri. core connect 1000 ohm load resistor across the 2nd I.F. secondary terminals. Input may have to be increased to .1 volt if receiver is *badly* mis-aligned.

NOTE E—Disconnect 1000 ohm load resistor from secondary terminals and connect across the 2nd I.F. primary terminals. Input may have to be increased to .1 volt if receiver is *badly* mis-aligned.

NOTE F—Input can be reduced to 10,000 microvolts.

NOTE G—Oscillator frequency above signal frequency.

NOTE H—Remove the 1000 ohm load resistor before attempting to check the R-F and oscillator adjustments.

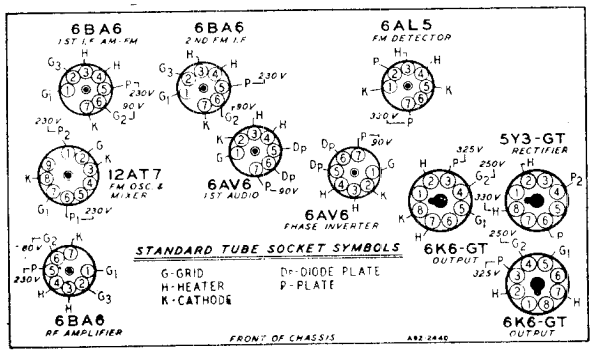
TUBE SOCKET VOLTAGES



Socket voltages are shown on the Bottom Socket diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage ..... 117 Volts AC
Signal Input ..... None
A variation of ±10% is usually permissible.

MODEL 94RA1-43-7751A

GENERAL DESCRIPTION

This radio is a 7 tube (including rectifier tube) AC receiver with automatic record changer, designed for reception of stations in the standard broadcast band between 540 and 1600 kilocycles and FM (Frequency Modulation) stations in the newly allocated FM Band of 88 - 108 megacycles. Controls are provided on the front panel for tuning, tone, volume and band or phono selection. Special features include two built-in antennas, automatic volume control, compensator circuits to prevent oscillator drift, beam power output stage, permanent magnet dynamic speaker and an electrostatic shield in the power transformer to reduce power line noise.

MODEL 94RA1-43-7751A

Tube and Dial Lamp Complement

1 6BA7 FM-AM Converter
1 6BA6 1st I-F Amplifier
1 6BA6 2nd I-F Amplifier
1 6AL5 FM Discriminator
1 6AV6 Audio Amplifier, AM 2nd Detector and AVC
1 6V6GT Audio Output
1 6X5GT Rectifier
2 No. 47 Dial Lamp

ELECTRICAL SPECIFICATIONS

Power Consumption —
117 volts AC—60 cycles 35 Watts
55 watts phono operating

Power Output —
1.5 watts maximum
.9 watts 10% distortion

Speaker—8" PM dynamic

Frequency Ranges —
Broadcast 540-1600 KC
Frequency modulation 88-108 MC

Intermediate Frequency —
AM 455 KC — FM 10.7 MC

Selectivity — AM — 60 KC broad at 1000 times signal, measured at 1000 KC

I.F. FM—200 KC broad at 2 times down

I.F. FM — 700 KC broad at 200 times down

AM Sensitivity—(For .5 watt output with external antenna)
10 microvolts average

FM Sensitivity—(For .5 watt output)
100 microvolts average

DRIVE CORD REPLACEMENT

Replacement of the drive cord may be accomplished as shown in the illustration. For this purpose use the new drive cord assembly listed in the Replacement Parts List. Turn the gang condenser until the plates are fully meshed. Then install the string as shown, winding three turns clockwise around the tuning shaft with the turns progressing away from the chassis. After the cord is installed, rotate the tuning shaft several times in order to take up any slack in the cord.

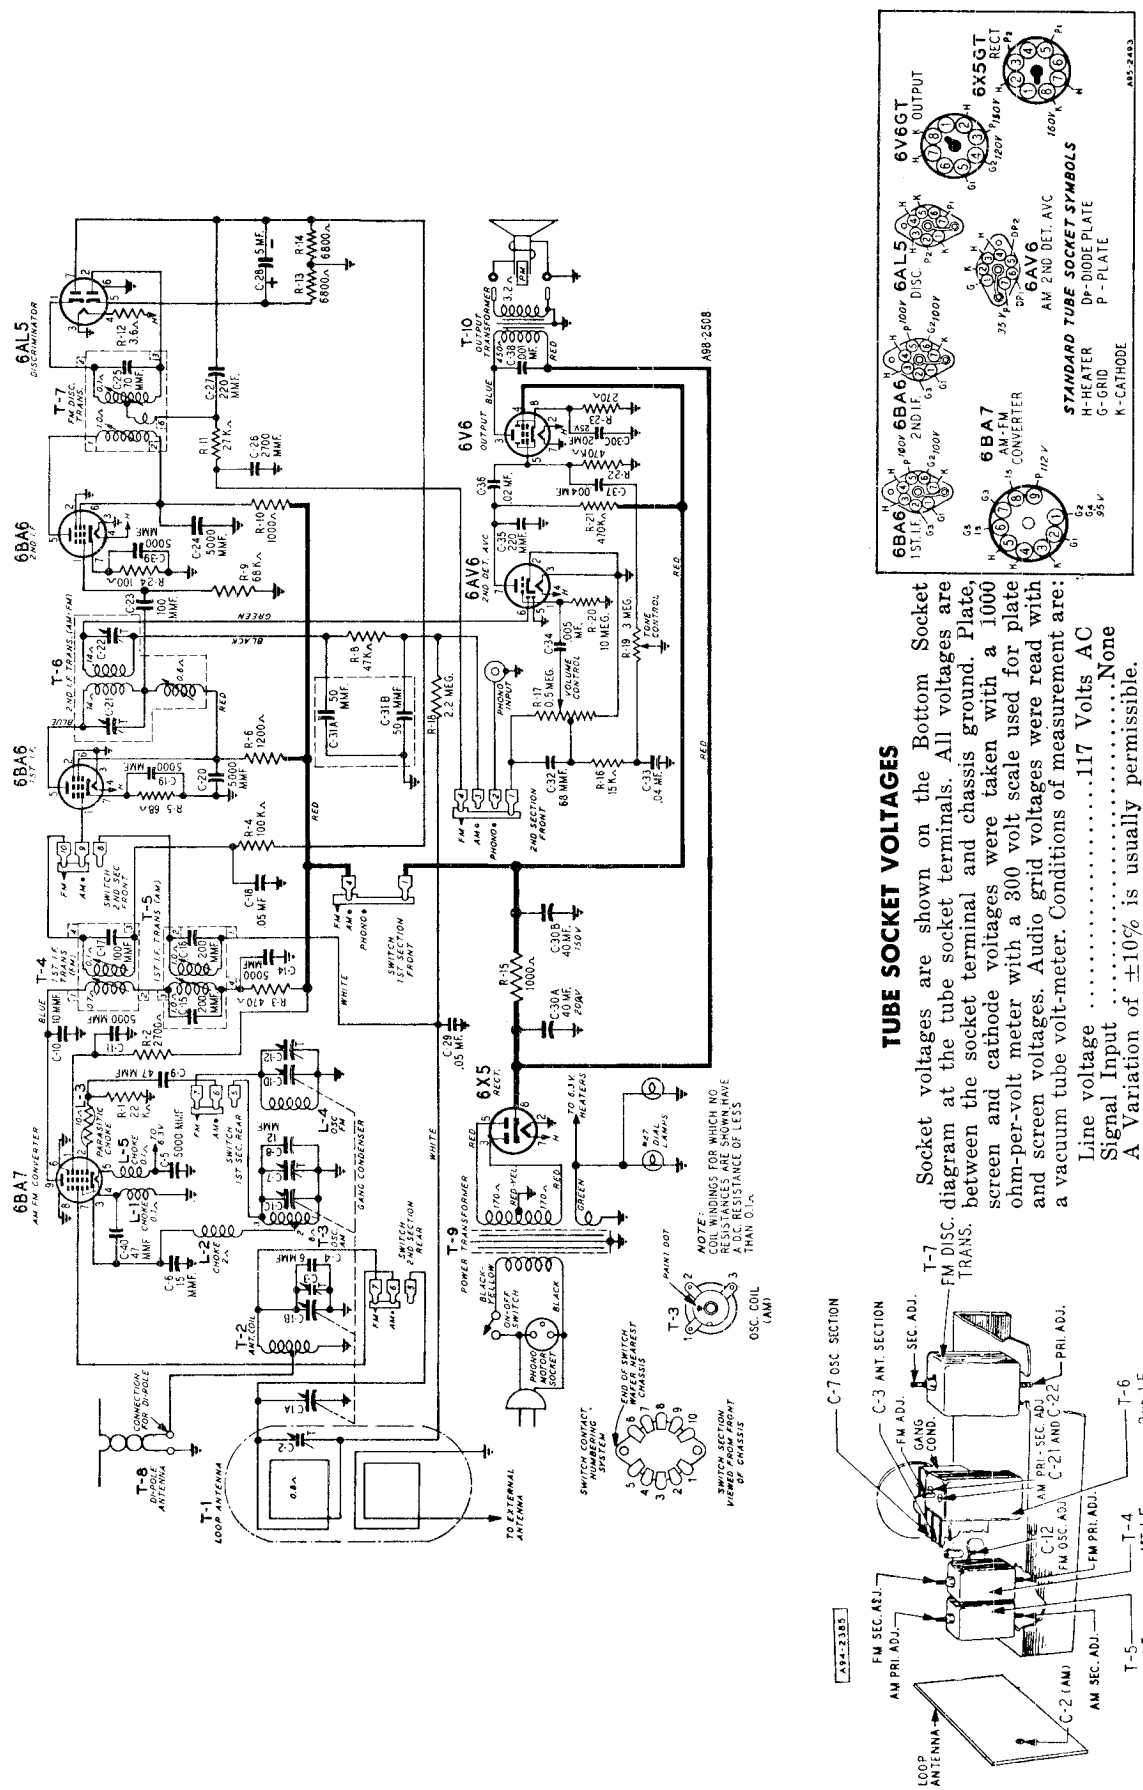
MODEL 94RA1-43-7751A



TUBE SOCKET VOLTAGES

Socket voltages are shown on the Bottom Socket diagram at the tube socket terminal and chassis ground. Plate, between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage .....117 Volts AC
Signal Input .....None
A Variation of ±10% is usually permissible.

MODEL 94RA1-43-7751A

ALIGNMENT PROCEDURES

AM STAGES

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS AND TRIMMERS
455 KC	Control Grid 1st 6BA6 Pin No. 1	Chassis Base	.1 mf	Turn Rotor to Full Open	2nd I.F. C-21 & C-22
455 KC	Control Grid 6BA7 Pin No. 7 1st Det.	Same as above	.1 mf	Turn Rotor to Full Open	1st I.F. Pri. & Sec.
1620 KC	Control Grid 6BA7 Pin No. 7	Same as above	.1 mf	Turn Rotor to Full Open	Oscillator C-7
1400 KC	External Antenna Clip	Same as above	50 mmf	Turn Dial to 1400 KC. See Note A	Antenna C-2

NOTE A—Set pointer at the 1400 KC mark on the dial scale. Attach pointer to drive cord.

FM STAGES

Allow chassis and signal generator to warm up for several minutes.

The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms and a 3300 ohm .5 watt resistor with short leads.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it to the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I-F Trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

GENERAL DESCRIPTION

Your new radio is a 7 tube (including rectifier tube) AC receiver designed for reception of stations in the standard broadcast band between 540 and 1600 kilocycles and FM (Frequency Modulation) stations in the newly allocated FM band of 88 - 108 megacycles. Controls are provided on the front panel for tuning, tone, volume and band or phono selection. Special features include two built-in antennas, automatic volume control, compensator circuits to prevent oscillator drift, beam power output stage, permanent magnet dynamic speaker and an electrostatic shield in the power transformer to reduce power line noise. A socket labeled PHONO is provided on the back of the chassis to which an external record player may be connected.

Tube and Dial Lamp Complement

1 6BE6 FM-AM Converter
1 6BA6 1st I-F Amplifier
1 6BA6 2nd I-F Amplifier
1 6AL5 FM Discriminator
1 6AV6 Audio Amplifier, AM 2nd Detector and AVC
1 6V6GT Audio Output
1 6X5GT Rectifier
1 No. 47 Dial Lamp

ELECTRICAL SPECIFICATIONS

Power Consumption—
117 volts AC—35 watts

Power Output—
1.5 watts maximum
.9 watts 10% distortion

Speaker—4 x 6 inch oval PM dynamic

Frequency Ranges—
Broadcast 540-1600 KC
Frequency modulation 88-108 MC

Intermediate Frequency—
AM 455 KC — FM 10.7 MC

Selectivity — AM — 60 KC broad at 1000 times signal, measured at 1000 KC
I.F. FM—200 KC broad at 2 times down
I.F. FM—700 KC broad at 200 times down

AM Sensitivity—(For .5 watt output with external antenna)
60 microvolts average

FM Sensitivity—(For .5 watt output)
150 microvolts average

ALIGNMENT PROCEDURES

AM STAGES

Volume Control Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50 mmf.

SIGNAL GENERATOR					
FREQUENCY SETTING	CONNECTION AT RADIO	GROUND CONNECTION	DUMMY ANTENNA	GANG CONDENSER SETTING	ADJUST TUNING SLUGS AND TRIMMERS
455 KC	Control Grid 1st 6BA6 Pin No. 1	Chassis Base	.1 mf	Turn Rotor to Full Open	2nd I.F. C-14 & C-17
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	Same as above	.1 mf	Turn Rotor to Full Open	1st I.F Pri. & Sec.
1620 KC	Control Grid 6BE6 Pin No. 7	Same as above	.1 mf	Turn Rotor to Full Open	Oscillator C-39
1400 KC	External Antenna Clip	Same as above	50 mmf	Turn Dial to 1400 KC. See Note A	Antenna C-35

NOTE A—Attach pointer to drive cord and position at 1400 KC mark on dial scale.

FM STAGES

Allow chassis and signal generator to warm up for several minutes. The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 100 K ohms.

Zero center scale DC vaccum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)

	SIGNAL GENERATOR

	104.5	Same as above	300 ohms	FM	Tune rotor for max. AVC voltage	Ant. C-37
	RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN					

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator adjustments.

NOTE E—2nd I-F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

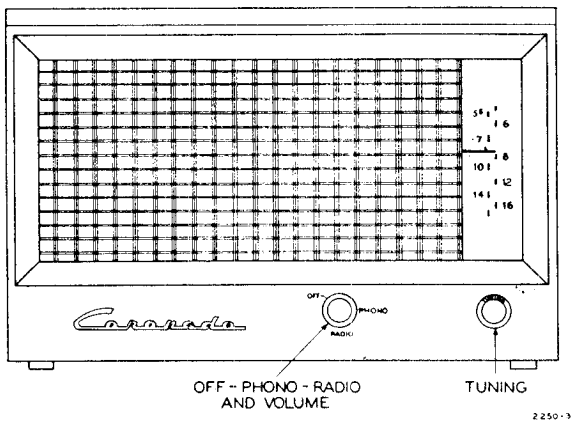
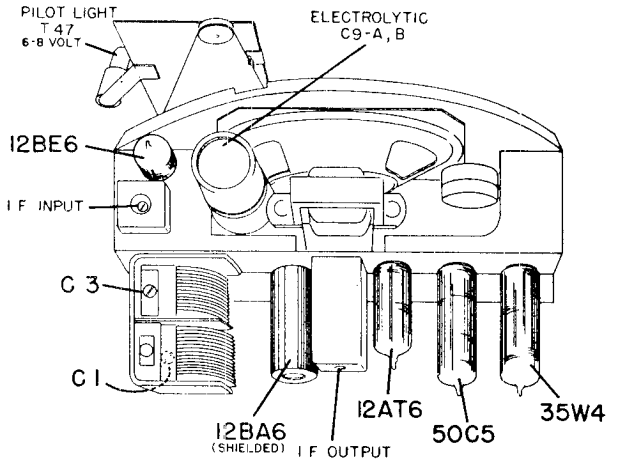
MODEL 94RA2-43-9195A

Power Supply.....105-125 volts, AC or DC
Frequency on AC.....50 to 60 cycles
Power Consumption....Radio 25 watts, Phono 50 watts
Frequency Range.....540 to 1650 KC
Intermediate Freq......455 KC
Antenna.....Built in loop, provision for external antenna
Tuning.....2-gang condenser, vernier drive
Speaker.....4-inch PM Dynamic, V.C. Impedance 3.2 ohms
Power Output.....1.0 watt undistorted, 1.5 watts maximum
Antenna Sensitivity.....75 microvolts average for 50 milliwattt output
Selectivity.....70 KC wide at 1000 x signal at 1000 KC
Tube Complement.....12BE6 Converter; 12BA6 IF Amp.; 12AT6 Det.-AVC-Audio; 50C5 Output; 35W4 Rectifier.
Phonograph.....VM Type 800 (See Manual 619-5)
Volume Control.....Fader type, clockwise radio, counterclockwise phono, center minimum volume





ALIGNMENT PROCEDURE

Allow unit to heat for a few minutes before starting alignment.
Volume control set to maximum.
Output meter across speaker.

- Align for maximum output.
- Keep input as low as readable meter reading of output will permit.

DRIVE CORD REPLACEMENT

BRC(5D153) - Part No. 23D-17670
PRO. B-30 G-3M—S-500—041849

MODELS 94RA31-43-8115A,
94RA31-43-8115B, 94RA31-43-8116A

POWER SUPPLY

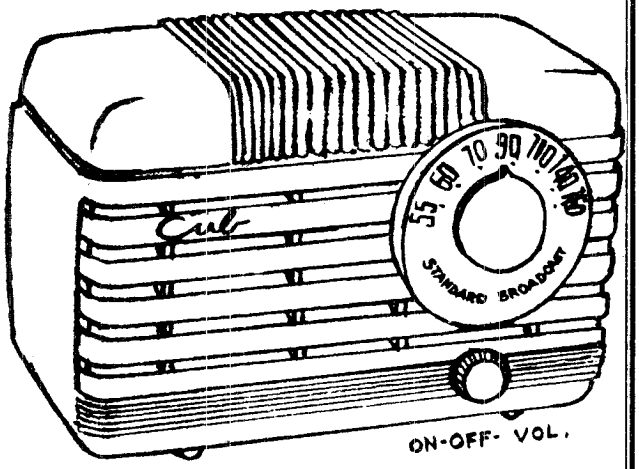
This receiver is designed to operate on either an A.C. or D.C. power supply. The following operation ratings should be observed:

Voltages ..... 105-125 Volts, A.C. or D.C.
Frequency ..... 50 to 60 cycles on A.C.

If in doubt as to the voltage and frequency supplied to your home, telephone your local power company.

When operating on a D.C. source, it is necessary to insert the power plug with the proper polarity. If the set fails to function after an interval sufficient for the tubes to reach their operating temperature, reverse the power plug in the outlet.

NOTE:
REPLACEMENT PARTS LIST WILL SERVE FOR ALL THREE MODELS.



Remove back to replace tubes

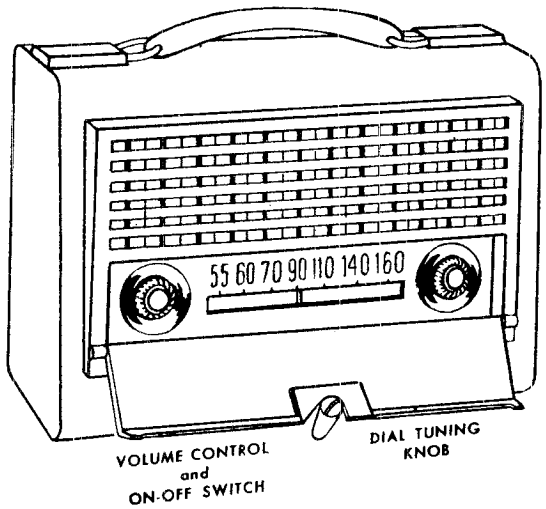
SERVICE DATA

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts DC or 50-60 cycles AC 15 watts
Batteries	A—4½ volts. 100 ma. B—67½ volts. 8 ma. average.
Frequency Range	532½ to 1620 kc.
Intermediate Freq.	455 kc.
Tuning	Two-gang capacitor
Antenna	Built-in loop
Speaker	4 inch PM; voice coil Impedance 3.5 ohms.
Power Output	80 milliwatts undistorted 140 milliwatts maximum
Sensitivity	750 microvolts per meter for 50 milliwatt output
Selectivity	55 kc broad at 1000 times signal at 1000 kc.



INSTALLATION

TUBES

Be sure each of the tubes is in place and inserted firmly in its socket.

The tube location of each tube is shown on the card attached to the back of the cabinet. Your receiver is equipped and tested at the factory with the tubes that are shipped with it.

POWER SUPPLY

This receiver is designed to operate on either an A.C. or D.C. power supply. The following operation ratings should be observed:

Voltages ..... 105 125 Volts, A.C. or D.C.
Frequency ..... 50 to 60 cycles on A.C.

If in doubt as to the voltage and frequency supplied to your home, telephone your local Power Company.

When operating on a D.C. source, it is necessary to insert the power plug with the proper polarity. If the set fails to function after an interval sufficient for the tubes to reach their operating temperature, reverse the power plug in the outlet.

The battery supply to be used with this receiver is as follows:

"A" supply ..... 4½ volts
Use Coronado No. 42-266 or equivalent.

"B" supply ..... 67½ volts.
Use Coronado No. 42-304 or equivalent.

ANTENNA SYSTEM

This receiver is equipped with a built in Antenna System, which obviates the necessity of using an antenna connection for receiving most local, and some distant stations.

When tuning Broadcast Stations, it may be found advisable to rotate the radio about its position of rest until the most distant station regularly enjoyed is heard the clearest. In some vicinities where there is a localized noise interference prevalent, it is best to rotate the radio cabinet to a position which gives a minimum of noise.

OPERATION

TO OPERATE ON AC OR DC

Plug the line cord into the nearest convenient wall outlet through the opening provided in the back.

TO OPERATE ON BATTERIES

To operate on batteries insert line cord plug in chasis receptacle as shown in diagram.

©John F. Rider

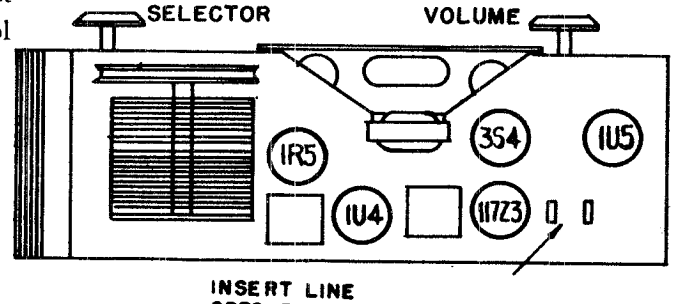
MODEL 94RA31-43-9841A

TUNING CONTROL

The knob at the right is the tuning control. Stations are tuned manually by turning this tuning control. The dial calibration numbers are in tenths of the actual kilocycle readings. To convert these calibrations to kilocycles, as is shown in most radio log books, add a "0" to the end of each number. After the desired station is heard, adjust this knob to the point of maximum volume and most realistic reproduction. This position of exact tune is very important as it is only when the receiver is in this position that the full, rich tone is available. The volume control may now be set to give the desired volume.

VOLUME CONTROL and POWER SWITCH

The volume control and power switch are operated by a common control knob at the left of the cabinet. When the control is in extreme counter-clockwise position, the receiver power is off. From this position a slight clockwise rotation will turn the power on and by further clockwise rotation, volume may be increased until the full output of the receiver is obtained. To conserve batteries and tubes, be sure that the receiver is turned off when it is not in use.



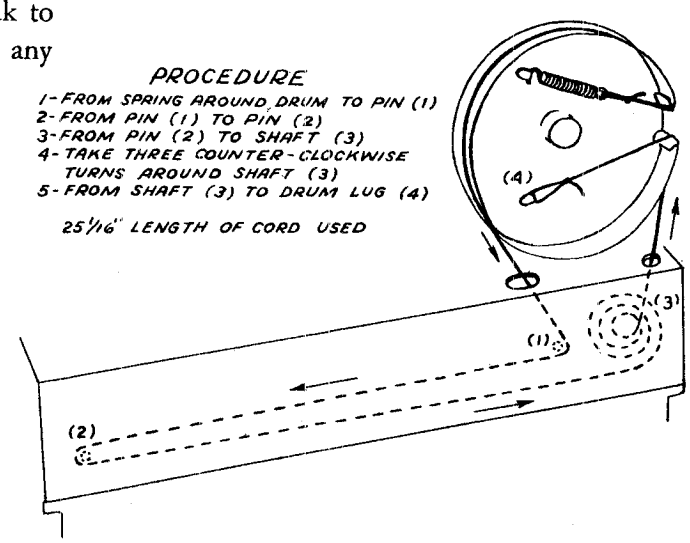
INSERT LINE CORD PLUG HERE FOR BATTERY OPERATION

MAINTENANCE

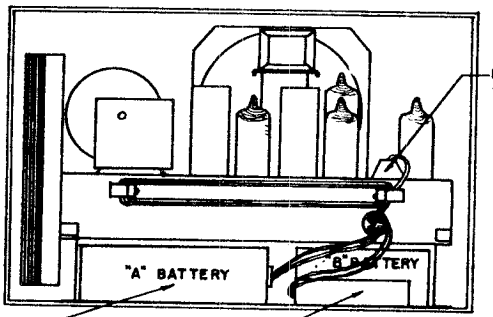
CAUTION

Always remove the power cord from its receptacle before starting to replace tubes or batteries.

Do not allow cells which have become too weak to operate the set properly to remain in the set for any length of time.



PROCEDURE
1-FROM SPRING AROUND DRUM TO PIN (1)
2-FROM PIN (1) TO PIN (2)
3-FROM PIN (2) TO SHAFT (3)
4-TAKE THREE COUNTER-CLOCKWISE TURNS AROUND SHAFT (3)
5-FROM SHAFT (3) TO DRUM LUG (4)
25 1/16" LENGTH OF CORD USED
(4)
(3)
(1)
(2)



Line cord plug shown in position for battery operation, with line cord wrapped around line cord retainers.

For A.C.-D.C. operation remove plug from chassis, unwrap cord and bring out of notch in side of cover.

Insert two-prong plug into "A" BATTERY. Make sure large pin engages large contact in battery. Excessive force is not required to push plug into battery.

Place "B" BATTERY so that contacts are toward bottom. Snap fasteners onto battery.

©John F. Rider

MODEL 94RA31-43-9841A

ALIGNMENT PROCEDURE

- Output meter across 3.2 ohm output load.
- Volume control at maximum for all adjustments.
- Align for maximum output. Reduce input as needed to keep output near 0.4 volts.

SIGNAL GENERATOR				SETTING TUNER	ADJUST TRIMMERS TO MAXIMUM OUTPUT (in order shown)
Frequency	Coupling Factor	Connection to Receiver	Ground Connection		
455 kc	.1 mfd	1R5 Grid	B—	Rotor full open (Plates out of mesh)	Input and output trimmers on IF cans
1620 kc	.1 mfd	1R5 Grid	B—	Rotor full open (Plates out of mesh)	Oscillator trimmer T2
1400 kc		Radiating Loop		1400 kc*	Antenna trimmer T1

Five markings on the dial bracket represent respectively 532½ kc., 600 kc., 1000 kc., 1400 kc. and 1620 kc., reading from left to right. These points are to be used for the alignment of the receiver.

REPLACEMENT PARTS LIST

When ordering parts, specify part number, model number and series.

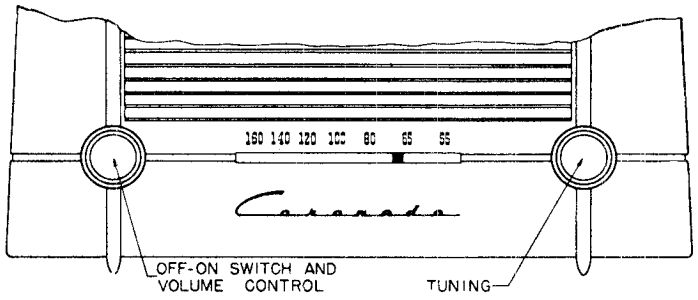
MODELS 94RA33-43-8130C,
94RA33-43-8131C



ALIGNMENT PROCEDURE

The following procedure is for use only by competent servicemen having the proper equipment.

The alignment should be made with volume control fully on, and the output from the Signal Generator as low as possible, to prevent AVC action from interfering with proper alignment.

With the output meter connected across the voice coil of the speaker, the output meter reading for 50 milliwatts is 0.4 volts, using a signal which is modulated 400 c.p.s.

Adjust all trimmers for maximum output. Repeat the alignment procedure given below as a final check.

CAUTION: This is an AC/DC receiver and when aligning the set it is necessary to isolate the Signal Generator or the Receiver from the line by use of a transformer, or to place a .2 MFD condenser in each test lead of the Signal Generator.

SIGNAL GENERATOR Frequency	Dummy Antenna	Connection to Radio	POSITION OF VARIABLE	ADJUST FOR MAXIMUM OUTPUT
455 KC	.1 MFD	12SA7 Grid	Fully	T1 & T2
		Stator C1A	Open	
1630 KC	.1 MFD	12SA7 Grid	Fully	C1B
		Stator C1A	Open	Oscillator
1400 KC		Loosely Coupled To Loop	Tune in Signal Generator	C1A Antenna

Connect low side of Signal Generator to common negative.

PARTS VALUES FOR T-65 GAMBLE'S AC-DC MUSETTE

MODEL 4SJ3A1

SPECIFICATIONS

Physical Dimensions:
Width 14½ in.
Depth 14½ in.
Height 23½ in.
Weight 18 lbs.

Power Consumption 50 watts

Electrical Data:

Tuning Range—500-1600 kc.
Intermediate Freq.—455 kc.
Power Output—½ watt

Model 4SJ3A1

Loudspeaker
5¼ in. PM, voice coil 3.20 ohms at 400 cycles

Pickup—High impedance crystal

Tube Complement:
1 12SA7 Converter
1 12SQ7 Detector, 1st Audio Amplifier
1 50L6GT Power Output
1 35Z5GT Rectifier

DESCRIPTION

The model 4SJ3A1 is an AC toy radio-phonograph employing a superheterodyne circuit.

ALIGNMENT INSTRUCTIONS

1. Turn S1 to Radio and volume to maximum. Connect an output meter across the speaker voice coil. Connect generator ground to B- through a .1 mfd. condensor, and the high side to pin 8 of the 12SA7 tube through .03 mfd. Tune generator to 445 kc. and tune T1 trimmers for maximum output reading.
2. Remove generator connection to pin 8, unsolder antenna and attach generator to L1 through 25 mmfd. Turn tuning condenser of set fully open. Set generator to 1620 kc. Tune oscillator trimmer on tuning gang for maximum reading; set R.F. trimmer for maximum output reading. Use only enough generator output to get a reading on the output meter.

SPECIFICATIONS

CABINET:

	64	65
Model		
Color	Brown Mahogany	Ivory
Height	6⅜ in.	6⅜ in.
Width	11½ in.	11½ in.
Depth	6¼ in.	6¼ in.

ELECTRICAL RATING (INPUT):

Voltage ..... 105-120 volts, a-c
Frequency ..... 60 cycles
Wattage ..... 30 watts

OPERATING FREQUENCIES:

Intermediate Frequency ..... 455 kc
Broadcast Band ..... 540-1600 kc

POWER OUTPUT:

Undistorted 1
Maximum 1.75

LOUDSPEAKER:

Type ..... Alnico 5 PM
Outside Cone Diameter 4-inch
Voice Coil Impedance (400 cycles) ..... 3.5 ohms

TUBE COMPLEMENT:

Oscillator-Converter ..... Type 12SA7
I-F Amplifier ..... Type 12SK7
Detector and 1st Audio ..... Type 12SQ7
Power Output ..... Type 50C5
Rectifier ..... Type 35W4

CAUTION: One side of the power line is connected to B–. Avoid any ground connections direct to B–. Use an isolating transformer when making service adjustments with the chassis removed from the cabinet.

RADIO CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES:

R-F ..... 1500 kc
R-F ..... 1620 kc
I-F ..... 455 kc

EQUIPMENT REQUIRED:

1. Test oscillator with tone modulation.
2. A-c output meter, 1½ volts full scale.
3. 0.05 mf. paper capacitor.
4. Loop.
5. Insulated screwdriver.

PROCEDURE—GENERAL:

1. With the tuning scale control wheel turned so that the gang condenser plates are fully meshed, the index should read approximately $\frac{3}{16}$ inch to the right of the 550 kc scale calibration mark. If it does not, remove the control wheel from the gang condenser shaft and replace it for correct position. CAUTION: Do not attempt to correct the position by rotating the wheel on the shaft as this will cause the knob to slip.
2. For i-f alignment, it is necessary to remove the chassis from the cabinet.
3. Connect the output meter across the loudspeaker voice coil terminals.
4. Keep radio volume control at maximum and attenuate the test oscillator signal output so that the output meter reading never exceeds 1.0 volt.
5. Connect the capacitor as listed in column 2 between the output "High Side" of the test oscillator and the point of input specified. The oscillator output cable ground lead is connected to receiver chassis.
6. For alignment of the oscillator and antenna trimmers, the input signal should be inductively coupled to the radio loop antenna, L1, by connecting a four-turn, six-inch diameter loop of bell wire across the signal generator output terminals, and then locating the loop to face the radio antenna loop about one foot away. To prevent possible errors in reference to previous signal measurement readings, the loop with respect to the radio loop should not be changed during any one set of adjustments.

ALIGNMENT CHART

Step	Connect Test Oscillator to	Test Osc. Setting	Dial Drum Setting	Adjust Trimmers for Maximum Output
1	12SK7 grid (4) in series with 0.05 mf. cap.	455 kc	Minimum Capacity	2nd i-f trans. trimmers, C14 and C15
2	12SA7 grid (8) in series with 0.05 mf. cap.	455 kc	Minimum Capacity	1st i-f trans. trimmers, C8 and C9
3	Inductively coupled to radio loop	1620 kc	Minimum Capacity	C4 (oscillator)
4	Inductively coupled to radio loop	1500 kc	Tune for Maximum	C3 (antenna)

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or imilar measuring devices may be used to check circuit perormance and isolate trou le. The gain values listed may have olerances of 20%. Readings taken with low signal input so hat AVC is not effective.

(1) I-F Stage Gains.

12SA7 Grid to 12SK7 Grid . . . . . 50 @ 455 kc
12SK7 Grid to 12SQ7 Diode Plate . . . . . 50 @ 455 kc

(2) Audio Gain.

0.15 volts at 400 cycles across the volume control (R11) with control set at maximum will give approximately ½-watt output across the loudspeaker, LS1, voice coil.

(3) Oscillator Grid Bias.

D-c voltage developed across the oscillator grid leak (R1) average 8.5 volts at 1000 kc.

(4) Socket Pin Voltages.

Figure 3 shows voltages from all tube pins to B– unless otherwise specified. Voltage readings much higher or lower than those specified may help localize defective components or tubes.

CLOCK SERVICE

Figures 4 and 5 show clock parts referred to in the following paragraphs and the parts list.

CLOCK MOVEMENT DISASSEMBLY

1. Remove clock movement from case. When removing knobs, note that the Alarm-Set knob is a left-hand thread, while Wake Up-Manual and Sleep are pull-off knobs.
2. Remove Bezel, Hands and Dial Faces.
3. Remove the motor assembly by removing two screws (3 and 4) and break two soldered joints on Field. The Field and Rotor Assembly (11 and 2) can now be removed. The Rotor is held by friction only, to the Field.
4. Remove Switch Assembly by removing two screws (12) from base plate.
5. Remove Switch Shaft Assembly (13) and spacer.
6. Remove Alarm-Set Shaft Assembly (6) and spacer.
7. Remove the three front plate assembly screws that are located under the Dial Face and then remove Front Plate.
8. Remove the following gear assemblies and control levers in the order listed below:

(a) Sweep Control Shaft and Segment Gear (30)
(b) Alarm Dial Gear (16)
(c) Hour Hand Gear (17)
(d) Alarm Signal Cam and Gear, and Friction Washer (27, 26)
(e) Sweep Control Switch Lever (29)
(f) Pinion Drive Gear Assembly (15) (drives Sleep Control Segment Gear)
(g) Alarm Control Switch Cam Lever (8)
(h) Time Set Shaft and Gear, and Spacer (14, 20)
(i) Drive Gear and Pinion Assembly (28)
(j) Minute Hand Gear (18)
(k) Sweep Second Hand Gear (19)

CLOCK MOVEMENT REASSEMBLY

Reassemble in the reverse order of disassembly, observing the following precautions:

1. The spring washer (26) should curve away from the gear when placed on the Alarm Cam Gear Assembly (27).
2. The Switch Cam Lever fork (8) must straddle the base plate post as shown in the illustration.
3. After reassembly of front plate, check the Sweep Second Gear (19) through the hole in the base plate to make sure it is free to turn.
4. Proceed with Alarm and Switch Adjustments as described below before installing hands.

ALARM AND SWITCH ADJUSTMENTS

1. Turn Wake Up-Manual shaft to ALARM position.
2. Slowly rotate Time Set shaft clockwise until the contacts 21 and 22 of the Switch Assembly close.
3. Replace Dial Face, Alarm Dial, the Minute, Hour and Second Hands. Set all Hands and Dial so that they indicate 12 o'clock. Make sure all Hands and Alarm Dial are tight on their respective shafts.
4. With Alarm Set knob pulled out, continue to rotate Time Set shaft clockwise and note that the Alarm vibrator arm drops against field core approximately 7–10 minutes later.
5. Set alarm at some other selected position and make sure mechanism actuates within limits (±1 minute).
6. Check alarm tone of vibrator. This can be adjusted by either bending vibrator arm nearer or farther away from field core. Bend arm near anchor point.

CLEANING AND LUBRICATION

To clean, completely disassemble and clean all moving parts in carbon tetrachloride or some similar cleaner.

The inside of the sleeves and shaft surfaces may be cleaned of oxidized oil by rubbing with a fine grade of steel wool dampened in carbon tetrachloride.

Do not use too much oil and apply by means of a small wire (drop oiler). Too much oil collects dust and later oxidizes. Use only recommended clock oil, such as Nye's Celebrated Oil which may be purchased from Wm. F. Nye Co., Inc., New Bedford, or equivalent.

CLOCK TROUBLES

1. Clock will not operate—Defective field coil, defective rotor, binding of parts.
2. Clock loses time—Binding parts, too little friction on minute hand sleeve assembly, defective rotor. Clock time set shaft bent and rubs against hole in clock bracket.
3. Noisy Clock—Rotor defective, alarm armature improperly adjusted, loose parts, or binding of moving parts.

PRODUCTION CHANGES

C16, C17, C19, AND C20

Early production receivers use individual component capacitors C16, C17, C19, and C20, while other chassis incorporate these in a single four-section unit, catalogued RCW-3013. Some differences in capacitor values for the above components may be noted in early receivers from that shown in the schematic diagram. These values are not critical, however, and the stock catalogue item corresponding to the capacitor symbol in the parts list can be used when replacement is necessary.

The lead identification for the four-section ceramic capacitor RCW-3013 (K67J836) can be observed from the illustration of Figure 6.

ANTENNA LOOP, RAB-054 AND RAB-097

Though the Models 64, 65, 66, and 67 Clock-Radio receivers have been designed and connected to operate with a single loop input inductance, some production was made using the loop and antenna primary assembly (RAB-054) of earlier model clock-radios (Models 60 and 62). This assembly of Cabinet Back with loop and antenna primary is illustrated with circuit connections for the Models 64, 65, 66, and 67, as shown in Figure 7. Connections to the primary circuit winding are not made.

In other productions of the Models 64, 65, 66, and 67 the single pick-up loop, L1 (antenna primary omitted) was incorporated in Cabinet Back RAB-097 whose circuit connections are given in Figure 8.

The two cabinet backs are interchangeable on all the above models.

RWL-016		CORD—Power cord (white) for Model 65
RZC-009	M1	CLOCK—60 cycle, 105-125 v., clock assembly

†CLOCK REPLACEMENT PARTS LIST

Cat. No.	Symbol	Description
MISCELLANEOUS		
XC3X36	1	KNOB—Time set shaft knob (bronze)
XC4X5		KNOB—Alarm set knob (ivory)
XC31X26		HAND—Sweep second hand
XC32X199		HANDS—Hour and minute hands (luminous)
XC53X31		BEZEL—Outer mounting rim
XC53X117		BEZEL—Numeral ring (gold finish)
XC55X15		DIAL—Alarm dial scale
XC58X16		CRYSTAL—Glass crystal
XC59X247		RING—Color ring for numeral bezel
XC59X716		KNOB—Wake-up Manual and Sleep control knob (ivory)
XC61X937		DIAL—Clock dial scale (luminous)
CLOCK MOVEMENT		
XC1X1	3	SCREW—Holds field core to baseplate, #4-40 x 1⅛" long, round head
XC1X2	4	LOCKWASHER—Under screw head of switch assembly mounting screw and field core mounting
XC1X6	10	SCREW—Used to assemble switch assembly to switch bracket
XC1X43	23	HEX NUT—For screw mounting switch assembly to switch bracket
XC10X141	14	SHAFT ASSEMBLY—Time set shaft and gear assembly
XC11X11	6	SHAFT ASSEMBLY—Alarm set shaft and gear assembly
XC13X11	17	GEAR ASSEMBLY—Hour hand gear and sleeve assembly
XC14X32	18	GEAR ASSEMBLY—Minute hand friction gear, pinion gear and sleeve assembly
XC15X3	16	GEAR ASSEMBLY—Alarm dial gear and sleeve assembly
XC16X14	19	GEAR ASSEMBLY—Sweep second hand gear and shaft assembly
XC17X8	27	GEAR AND CAM—Alarm signal cam and gear assembly
XC34X173	9	FRONT PLATE ASSEMBLY—Complete with case studs and alarm set shaft spring (7)
CLOCK MOVEMENT (Cont'd)		
XC35X93	25	BASE PLATE AND BACK GEAR—Base plate assembled complete with studs, back gear and pinion, and vibrator
XC40X76	24	SWITCH INSULATOR ASSEMBLY—Consists of: two plastic and one fibre switch contact spring spacers
XC40X77	28	GEAR AND SPRING ASSEMBLY—Drives alarm dial gear and hour hand gear (complete with pinion and shaft, pinion and gear, spring, washers and retaining clip)
XC40X80	21	CONTACT ASSEMBLY—Lower switch contact and spring
XC40X185		SPRING—Switch control shaft index spring (for cam indexed control shafts)
XC40X194	29	LEVER—Sleep control switch lever
XC40X196	15	GEAR AND SPRING ASSEMBLY—Pinion drive for sleep control segment gear (consists of pinion gear, pinion gear and shaft, spring, washers, and retaining clip)
XC40X197	8	LEVER—Alarm control switch cam lever
XC40X198	22	CONTACT ASSEMBLY—Upper switch contact and spring with attached fibre arm
XC40X202	5	SPACER BUSHING—Field core spacer at screw mounting to base plate
XC40X252	26	WASHER—Alarm signal cam and gear friction washer
XC40X275		SPACER BUSHING—Wake-up Manual switch control shaft bushing
XC40X276	20	SPACER BUSHING—For time set shaft
XC40X277	30	SHAFT—Sleep control shaft and gear segment assembly
XC44X38	2	MOTOR ROTOR ASSEMBLY—Cased rotor and pinion (60 cycles)
XC45X69	11	MOTOR FIELD ASSEMBLY—Consists of: core, shading poles, and field coil (60 cycles)
XC59X699	13	SHAFT ASSEMBLY—Wake-up Manual control shaft assembly (detent spring index type)
XC59X723	13	SHAFT ASSEMBLY—Wake-up Manual control shaft assembly (cam index type)
XC64X1		SCREW—Switch bracket and front plate mounting screws

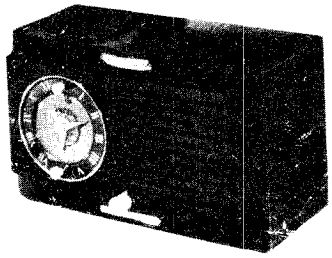
MODELS 66, 67,
Clock Radio



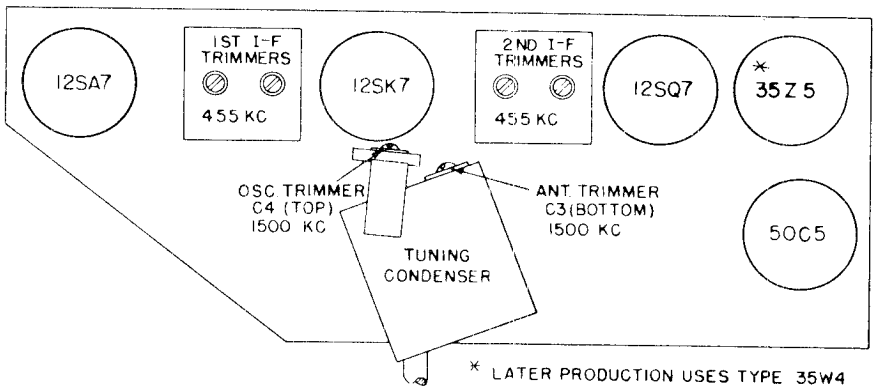


Fig. 1. Tube and Trimmer Location

SPECIFICATIONS

CABINET:

	66	67
Model		
Color	Mahogany	Ivory
Height	$6\frac{3}{16}$ in.	$6\frac{3}{16}$ in.
Width	$10\frac{1}{2}$ in.	$10\frac{1}{2}$ in.
Depth	$5\frac{3}{8}$ in.	$5\frac{3}{8}$ in.

ELECTRICAL RATING (INPUT):

Voltage	105-120 volts, a-c
Frequency	60 cycles
Wattage	30 watts

OPERATING FREQUENCIES:

Intermediate Frequency	455 kc
Broadcast Band	540-1600 kc

POWER OUTPUT:

Undistorted	1
Maximum	1.75

LOUDSPEAKER:

Type	Alnico 5 PM
Outside Cone Diameter	4-inch
Voice Coil Impedance (400 cycles)	3.5 ohms

TUBE COMPLEMENT:

Oscillator-Converter	Type 12SA7
I-F Amplifier	Type 12SK7
Detector and 1st Audio	Type 12SQ7
Power Output	Type 50C5
Rectifier (early production)	Type 35Z5GT
Rectifier (late production)	Type 35W4

CAUTION: One side of the power line is connected to B—. Avoid any ground connections direct to B—. Use an isolating transformer when making service adjustments with the chassis removed from the cabinet.

PRODUCTION CHANGES:

1. Later production receivers use a 35W4 type rectifier tube in place of the Type 35Z5 tube in the first production chassis. Insets in Figure 2 and Figure 3 show the changes in wiring and voltage measurements respectively, where the 35W4 type rectifier is substituted for the 35Z5.
2. Early production receivers also use individual component capacitors C16, 17, 19, and 20; while later chassis incorporate these capacitors in a four-section unit cataloged RCW-3013.

RADIO CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES:

R-F	1500 kc
R-F	1620 kc
I-F	455 kc

EQUIPMENT REQUIRED:

1. Test oscillator with tone modulation.
2. A-c output meter, $1\frac{1}{2}$ volts full scale.
3. 0.05 mf. paper capacitor.
4. Loop.
5. Insulated screwdriver.

PROCEDURE—GENERAL:

1. With the tuning scale control wheel turned so that the gang condenser plates are fully meshed, the index should read approximately $\frac{3}{16}$ inch to the right of the 550 kc scale calibration mark. If it does not, remove the control wheel from the gang condenser shaft and replace it for correct position. CAUTION: Do not attempt to correct the position by rotating the wheel on the shaft as this will cause the knob to slip.
2. For i-f alignment, it is necessary to remove the chassis from the cabinet.
3. Connect the output meter across the loudspeaker voice coil terminals.
4. Keep radio volume control at maximum and attenuate the test oscillator signal output so that the output meter reading never exceeds 1.0 volt.
5. Connect the capacitor as listed in column 2 between the output "High Side" of the test oscillator and the point of input specified.
6. For alignment of the oscillator and antenna trimmers, the input signal should be inductively coupled to the radio loop antenna, L1, by connecting a four-turn, six-inch diameter loop of bell wire across the signal generator output terminals, and then locating the loop to face the radio antenna loop about one foot away. To prevent possible errors in reference to previous signal measurement readings, the loop with respect to the radio loop should not be changed during any one set of adjustments.

ALIGNMENT CHART

Step	Connect Test Oscillator to—	Test Osc. Setting	Dial Drum Setting	Adjust Trimmers for Maximum Output
1	12SK7 grid (4) in series with 0.05 mf. cap.	455 kc	Minimum Capacity	2nd i-f trans. trimmers, C14 and C15
2	12SA7 grid (8) in series with 0.05 mf. cap.	455 kc	Minimum Capacity	1st i-f trans. trimmers, C8 and C9
3	Inductively coupled to radio loop	1620 kc	Minimum Capacity	C4 (oscillator)
4	Inductively coupled to radio loop	1500 kc	Tune for Maximum	C3 (antenna)

STAGE GAIN AND VOLTAGE CHECKS

Stage gain measurements by vacuum tube voltmeter or similar measuring devices may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20%. Readings taken with low signal input so that AVC is not effective.

MODELS 66, 67, Clock Radio

(1) R-F and I-F Stage Gains.
12SA7 Grid to 12SK7 Grid.....50 @ 455 kc
12SK7 Grid to 12SQ7 Diode Plate.....50 @ 455 kc

(2) Audio Gain.
0.15 volts at 400 cycles across the volume control (R11) with control set at maximum will give approximately ½-watt output across the loudspeaker, LS1, voice coil.

(3) Oscillator Grid Bias.
D-c voltage developed across the oscillator grid leak (R1) averages 8.5 volts at 1000 kc.

(4) Socket Pin Voltages.
Figure 3 shows voltages from all tube pins to B— unless otherwise specified. Voltage readings much higher or lower than those specified may help localize defective components or tubes.

CLOCK SERVICE

Figure 4 shows clock parts referred to in the following paragraphs and the parts list.

CLOCK MOVEMENT DISASSEMBLY

1. Remove clock movement from case. When removing knobs, note that the Alarm-Set knob is a left-hand thread, while Alarm-Radio is a pull-off knob.
2. Remove Bezel, Hands and Dial Face.
3. Remove the motor assembly by removing two screws (A) and break two soldered joints on Field. The Field and Rotor Assembly (R) can now be removed. The Rotor is held by friction only to the Field.
4. Remove Switch Assembly (B) by removing two screws from base plate.
5. Remove Switch Shaft Assembly (C) and spacer.
6. Remove Alarm-Set Shaft Assembly (D) and spacer.
7. Remove the three front plate assembly screws that are located under the Dial Face and then remove Front Plate.
8. Remove Alarm Gear Sleeve Assembly (E), Hour Gear Sleeve Assembly (F), Minute Gear Sleeve Assembly (G), and Sweep Second Gear Shaft Assembly (H).
9. Remove Alarm Cam Gear Assembly (I) and Spring Washer (J).
10. Remove Alarm-Set Gear (K).
11. Remove Time-Set Gear and Shaft Assembly (L).
12. Remove Switch Cam Lever (M).

CLOCK MOVEMENT REASSEMBLY

Reassemble in the reverse order of disassembly, observing the following precautions:

1. The spring washer (J) should curve away from the gear when placed on the Alarm Cam Gear Assembly (I).
2. The Switch Cam Lever (M) fork must straddle the base plate post as shown in the illustration.
3. After reassembly of front plate, check the Sweep Second Gear (H) through the hole in the base plate to make sure it is free to turn.
4. Proceed with Alarm and Switch Adjustments as described below before installing hands.

ALARM AND SWITCH ADJUSTMENTS

1. Turn Alarm-Radio shaft to ALARM position.
2. Slowly rotate Time Set shaft clockwise until the contacts of the Switch Assembly (B) close.
3. Replace Dial Face, Alarm Dial, the Minute, Hour and Second Hands. Set all Hands and Dial so that they indicate 12 o'clock. Make sure all Hands and Alarm Dial are tight on their respective shafts.
4. With Alarm Set knob pulled out, continue to rotate Time Set shaft clockwise and note that the vibrator arm (N) drops against field core approximately 7–10 minutes later.
5. Set alarm at some other selected position and make sure mechanism actuates within limits (±1 minute).
6. Check alarm tone of vibrator. This can be adjusted by either bending vibrator arm nearer or farther away from field core. Bend arm near anchor point.

CLEANING AND LUBRICATION

To clean, completely diassemble and clean all moving parts in carbon tetrachloride or some similar cleaner.

The inside of the sleeves and shaft surfaces may be cleaned of oxidized oil by rubbing with a fine grade of steel wool dampened in carbon tetrachloride.

Do not use too much oil and apply by means of a small wire (drop oiler). Too much oil collects dust and later oxidizes. Use only recommended clock oil, such as Nye's Celebrated Oil which may be purchased from Wm. F. Nye Co., Inc., New Bedford, or equivalent.

CLOCK TROUBLES

1. Clock will not operate—Defective field coil, defective rotor, binding of parts.
2. Clock loses time—Binding parts, too little friction on minute hand sleeve assembly, defective rotor. Clock time set shaft bent and rubs against hole in clock bracket.
3. Noisy Clock—Rotor defective, alarm armature improperly adjusted, loose parts, or binding of moving parts.

GENERAL INFORMATION

The Model 123 and 124 is a five-tube a-c or d-c superheterodyne AM standard broadcast receiver equipped with an efficient built-in antenna loop and incorporating automatic volume control, an oversize permanent magnet speaker, and beam power output.

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED

1. Test oscillator, tone amplitude-modulated.
2. A-C output meter, 1½ volts full scale.
3. .05 mfd., paper capacitor.
4. Insulated screwdriver.
5. Coupling loop for test oscillator (see text).
6. Isolation power transformer.

ALIGNMENT PROCEDURE

The alignment steps are given in the table form of the Alignment Chart. Adjustment trimmers are shown in the illustration of Fig. 1.

1. The chassis is removed from the cabinet with the antenna loop and back attached and the speaker leads reconnected.
2. An isolation transformer should be used for the receiver power source when aligning or servicing, AC-DC receivers, to prevent short circuiting of equipment and shock hazard.
3. The output meter is connected across the terminals of the loudspeaker voice coil.
4. The receiver volume control should be turned to maximum and test oscillator signal output attenuated during alignment to develop not more than 1¼ volts output meter reading at the loudspeaker.
5. For i-f alignment, the high side of the signal generator output cable should be connected through a .05 mfd. paper capacitor to the points indicated in the Alignment Chart. The low side of the output cable is connected to the receiver chassis.
6. To align the oscillator and r-f trimmers, the signal generator output is inductively coupled to the radio loop, L1, by connecting a four-turn, six-inch diameter loop of bell wire across its output terminals and then locating the loop about one foot from the radio loop antenna. To prevent possible errors in comparative peak readings, the position of signal generator loop with respect to the radio loop antenna should not be changed during measurement.

GENERAL INFORMATION

The Model 135 and 136 are four-tube (plus rectifier tube) a-c or d-c superheterodyne AM standard broadcast receivers equipped with an efficient built-in antenna loop and incorporating automatic volume control, an oversize permanent magnet speaker, and beam power output.

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED

1. Test oscillator, tone amplitude-modulated.
2. A-C output meter, 1 1/2 volts full scale.
3. .05 mfd., paper capacitor.
4. Insulated screwdriver.
5. Coupling loop for test oscillator (see text).
6. Isolation power transformer.

ALIGNMENT PROCEDURE

The alignment steps are given in the table form of the Alignment Chart. Adjustment trimmers are shown in the illustration of Fig. 3.

1. The chassis is removed from the cabinet with the antenna loop and back attached and the speaker leads reconnected.
2. An isolation transformer should be used for the receiver power source when aligning or servicing AC-DC receivers, to prevent short circuiting of equipment and shock hazard.
3. The output meter is connected across the terminals of the loudspeaker voice coil.
4. The receiver volume control should be turned to maximum and test oscillator signal output attenuated during alignment to develop not more than 1 1/4 volts output meter reading at the loudspeaker.
5. For i-f alignment, the high side of the signal generator output cable should be connected through a .05 mfd. paper capacitor to the points indicated in the Alignment Chart. The low side of the output cable is connected to the receiver chassis.
6. To align the oscillator and r-f trimmers, the signal generator output is inductively coupled to the radio loop, L1, by connecting a four-turn, six-inch diameter loop of bell wire across its output terminals and then locating the loop about one foot from the radio loop antenna. To prevent possible errors in comparative peak readings, the position of signal generator loop with respect to the radio loop antenna should not be changed during measurement.

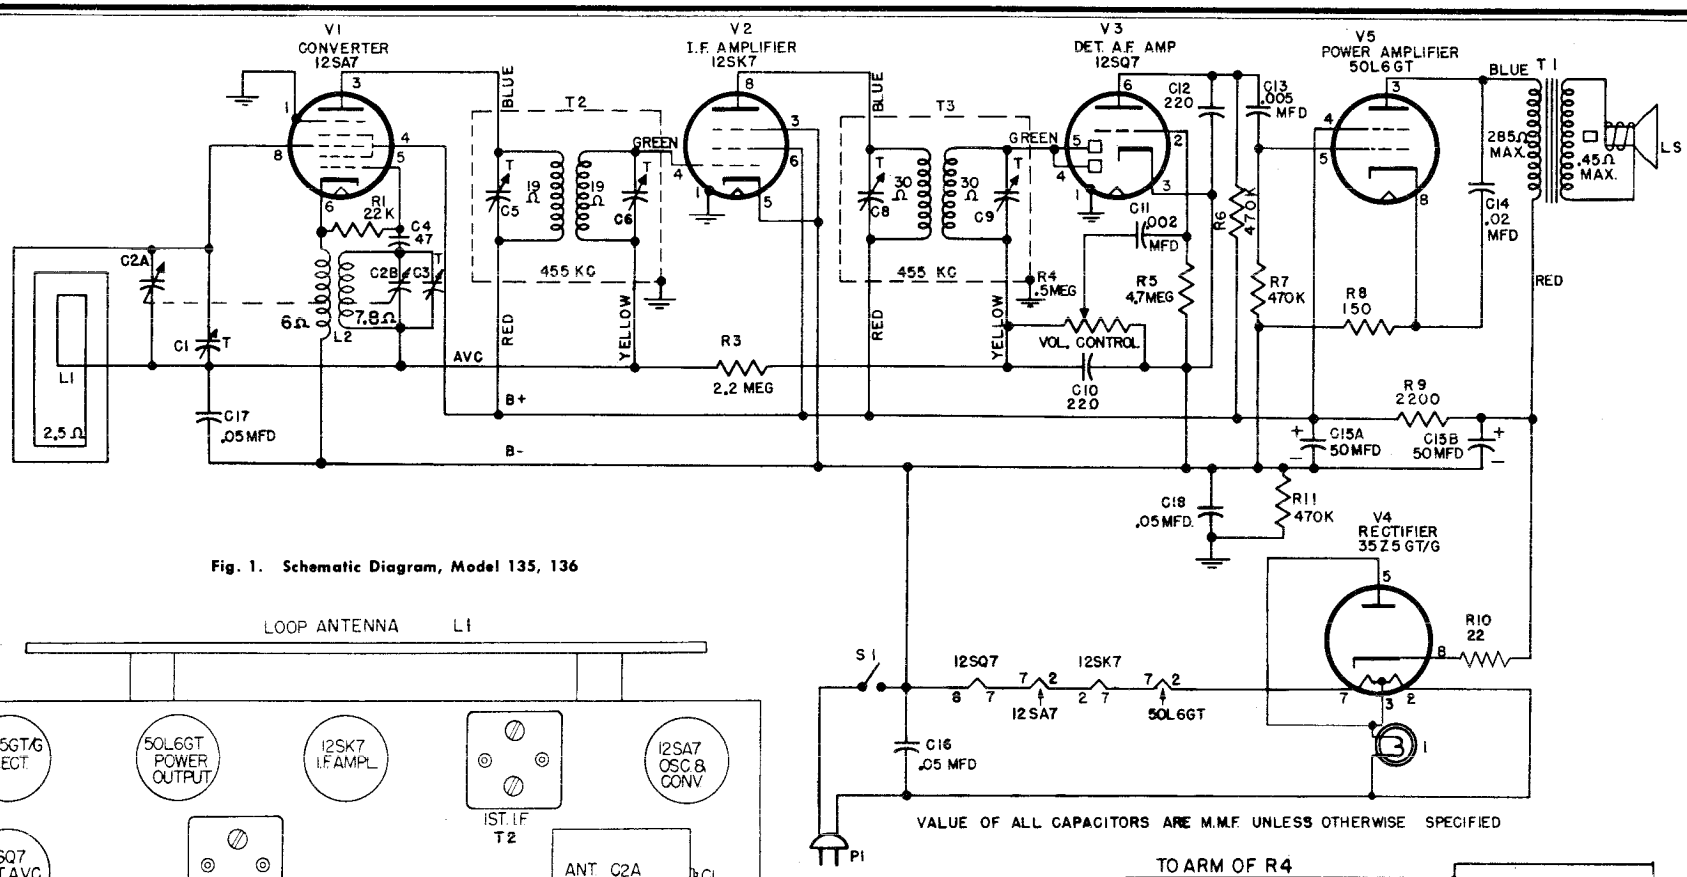

Fig. 1. Schematic Diagram, Model 135, 136

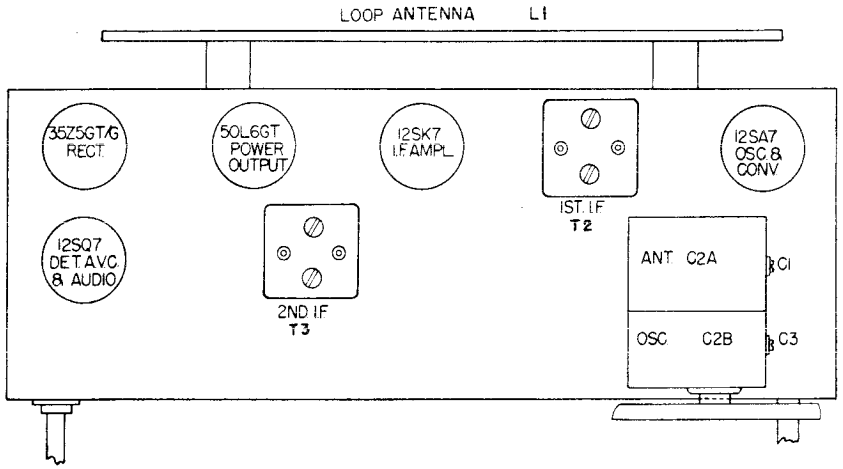

Fig. 3. Tube and Trimmer Location

CAPACITORS C10, 11, 12, AND C13

UNIT K67J836

Some production receivers use a four-section ceramic unit incorporating capacitors C10, 11, 12 and C13. The ceramic unit, RCW-3013, is illustrated in Fig. 2 for lead identification to capacitor sections and chassis circuit wiring. Other receivers may be found to have individual component capacitors in place of the four-section ceramic unit.

REPLACEMENT

If in a circuit analysis the ceramic unit is found to be defective; the entire unit may be replaced by the identical part RCW-3013 or, the defective section may be located and disconnected from the receiver circuit and the equivalent single components used in its place. The alternate capacitors are listed in the parts section as follows: UCC-036, C11, UCC-039, C13; and UCU-1036, C10 or C12.

GENERAL INFORMATION

The Model 141 or 143 portable radio is a four-tube superheterodyne broadcast receiver with a range of 540 to 1600 kc. The Model 141 operates on battery only, while for the Model 143 the power source may be either 105 to 125 volts, 50 to 60 cycles, or direct current, when a power outlet is available. The receiver will also operate from its battery source, thus making it independent of external electric power, providing excellent operation in any location where external power is not available.

BATTERY—AC OR DC OPERATION (MODEL 143 ONLY)

The left knob turns on the battery provided that the power plug is well inserted into the socket on the chassis.

For AC or DC supply (105-120 volts, 50 to 60 cycle operation), the same knob switches on the power when the power plug is pulled out of its socket on the chassis and inserted into the house outlet.

ELECTRICAL CIRCUIT ALIGNMENT

ALIGNMENT FREQUENCIES

R-F.....1620 and 1500 KC
I-F.....455 KC

EQUIPMENT REQUIRED

1. Test Oscillator with Tone Modulation.
2. AC Output Meter.
3. .05 Mf. Paper Capacitor.
4. Insulated Screwdriver.
5. Antenna Loop.

PROCEDURE—GENERAL

The Alignment Chart gives the alignment procedure with correct sequence of trimmer adjustments.

ALIGNMENT CHART

Step	Test-Osc. Connected to:	Test-Osc. Frequency	Radio Pointer Setting	Adjust for Maximum Meter Reading
1	1T4 grid (Pin 6) in series with .05 mf capacitor	455 KC	550 KC	2nd I-F transformer (T2) primary and secondary coils.
2	1R5 grid (Pin 6) in series with .05 mf capacitor	455 KC	550 KC	1st I-F transformer (T1) primary and secondary coils.
3	Inductively coupled	1620 KC	Gang condenser completely open	C2B
4	Inductively coupled	1500 KC	Tune for max. signal. Then set dial pointer at 1500 KC on dial mark	C1B

The chassis must be removed from the cabinet during i-f alignment.

The test oscillator output signal should be attenuated so that the output meter reading never exceeds ½ volt. Connect the capacitor listed in column 2 of Alignment Chart between the "high side" of the test oscillator and the point of input specified.

The output meter should be connected to the chassis ground; the "high side" of the oscillator output should be connected as indicated in the Alignment Chart. During the entire alignment procedure, the volume control should be at its maximum position. For alignment of the oscillator and r-f trimmers, the input signal should be inductively coupled to the radio loop antenna by connecting a 4-turn, 6-inch diameter loop of bell wire across the signal generator output terminals, and locate the loop about one foot from the radio loop antenna. To prevent possible errors in peak readings, the position of the loop with respect to the radio loop antenna should not be changed during any one set of adjustments.

STAGE GAIN AND VOLTAGE CHECKS

Stage gain by vacuum voltmeter or similar measuring device may be used to check circuit performance and isolate trouble. The gain values listed may have tolerances of 20 per cent. Reading should be taken with low signal input so that the AVC is not effective.

1. R-F STAGE GAINS

	141	143	
1R5 Grid (Pin 6) to 1T4 (Pin 6)	17	20	@1000 KC
1T4 Grid (Pin 6) to 1S5 Diode Plate (Pin 3)	65	50	@ 455 KC

2. AUDIO GAINS

.02 volt at 400 cycles across volume control (R4) with control set at maximum will give approximately .050 watts output across speaker voice coil.

3.

DC voltage developed across oscillator grid resistor (R1) averages 2.0 volts at 1000 kc with respect to B minus.

4. SOCKET PIN VOLTAGES

Fig. 5 and 6 show voltages from all tube pins to B—. Voltage readings much lower than those specified may help localize defective components or tubes.

GENERAL INFORMATION

The Model 165 portable radio is a five-tube superheterodyne broadcast receiver with a range of 540 to 1600 kc. The power source may be either 105–115 volts, 50–60 cycles a-c, or d-c, when a power outlet is available. The receiver will also operate from its battery source, thus making it independent of external electrical power, providing excellent operation in any location where external power is not available.

BATTERY—AC OR DC OPERATION.

The left knob turns on the battery, provided that the power plug is well inserted into the socket in the chassis.

For a-c or d-c supply (105–115 volts, 50 to 60 cycle operation), the same knob switches on the power when the power plug is pulled out of its socket in the chassis and inserted into the house outlet.

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED:

1. Test Oscillator with Tone Modulation.
2. A-C Output Meter.
3. Paper Capacitor .05 Mf.
4. Insulated Screwdriver.
5. Coupling Loop for Test Oscillator (see text).
6. Isolation Transformer.

PROCEDURE—GENERAL.

1. The Alignment Chart gives the alignment procedure with correct sequence of trimmer adjustments. The chassis must be removed from the cabinet during i-f alignment. The locations of the i-f and r-f adjustments are shown in Figure 2.

2. The "low" side of the test oscillator output should be connected to the chassis ground; the "high" side should be connected as indicated in the alignment chart. The test oscillator output signal should be attenuated so that the output meter reading never exceeds ½ volt. Connect the capacitor listed in column 2 of the alignment chart between the "high" side of the test oscillator and the point of input specified.

PRECAUTION: *If the signal generator is a-c operated, use an isolating transformer between the power supply and the radio receiver input. The use of an isolating capacitor is not recommended, as a-c through the capacitor will introduce hum modulation and/or create the possibility of a burned out signal generator attenuator.*

3. The output meter should be connected across the voice coil terminals of the speaker.

4. During the entire alignment procedure the volume control should be rotated clockwise to its maximum position.

5. For alignment of the oscillator and r-f trimmers, the input signal should be inductively coupled to the radio loop antenna by connecting a 4-turn, 6-inch diameter loop of bell wire across the signal generator output terminals, and locate the loop about one foot from the radio loop for alignment. The position of the loop with respect to the radio loop should not be changed during any one set of adjustments to prevent possible errors in peak readings.

6. The antenna loop acquires a different inductance in the position when the back is closed. Therefore, the adjustment of the antenna and r-f trimmers has to be made with the back closed, through the two openings on the right side of the cabinet which normally are closed by plug buttons. After adjustments have been completed, the two plug buttons have to be put in place again.

ALIGNMENT CHART

Step	Test-Osc. Connected to:	Test-Osc. Frequency	Radio Pointer Setting	Adjust for Maximum Meter Reading
1	1T4 I-F grid in series with .05 mf. capacitor	455 KC	550 KC	Iron cores of I-F transformer T2
2	1R5 converter grid in series with .05 mf. capacitor	455 KC	550 KC	Iron cores of I-F transformer T1
3	Repeat Step 1 and 2			
4	Inductively coupled	1500 KC	1500 KC	Trimmers C15 and C16*
5	Inductively coupled	600 KC	600 KC	Iron core of T4 on back apron of chassis.

*Chassis in cabinet and cabinet back (with loop) closed; remove plug buttons for adjustment.

STAGE GAINS AND VOLTAGE CHECKS

In order to check circuit performance and facilitate trouble shooting, the measurement of stage gain by means of a vacuum voltmeter or similar measuring device is recommended. The gain values listed may have tolerances of 20%. Readings should be taken with low signal input so that the AVC is not effective.

(1) R-F STAGE GAINS.

1T4 R-F Grid (Pin 6) to 1R5 Grid (Pin 6) .... 12 @ 1000 KC
1R5 Grid (Pin 6) to 1T4 Grid (Pin 6) ..... 18 @ 1000 KC
1T4 Grid (Pin 6) to 1S5 Diode Plate (Pin 3) .. 45 @ 455 KC

(2) AUDIO GAIN.

.020 volt at 400 cycles across volume control (R13) with control set at maximum will give approximately .05 watts output across speaker voice coil.

© John F. Rider

MODEL 165

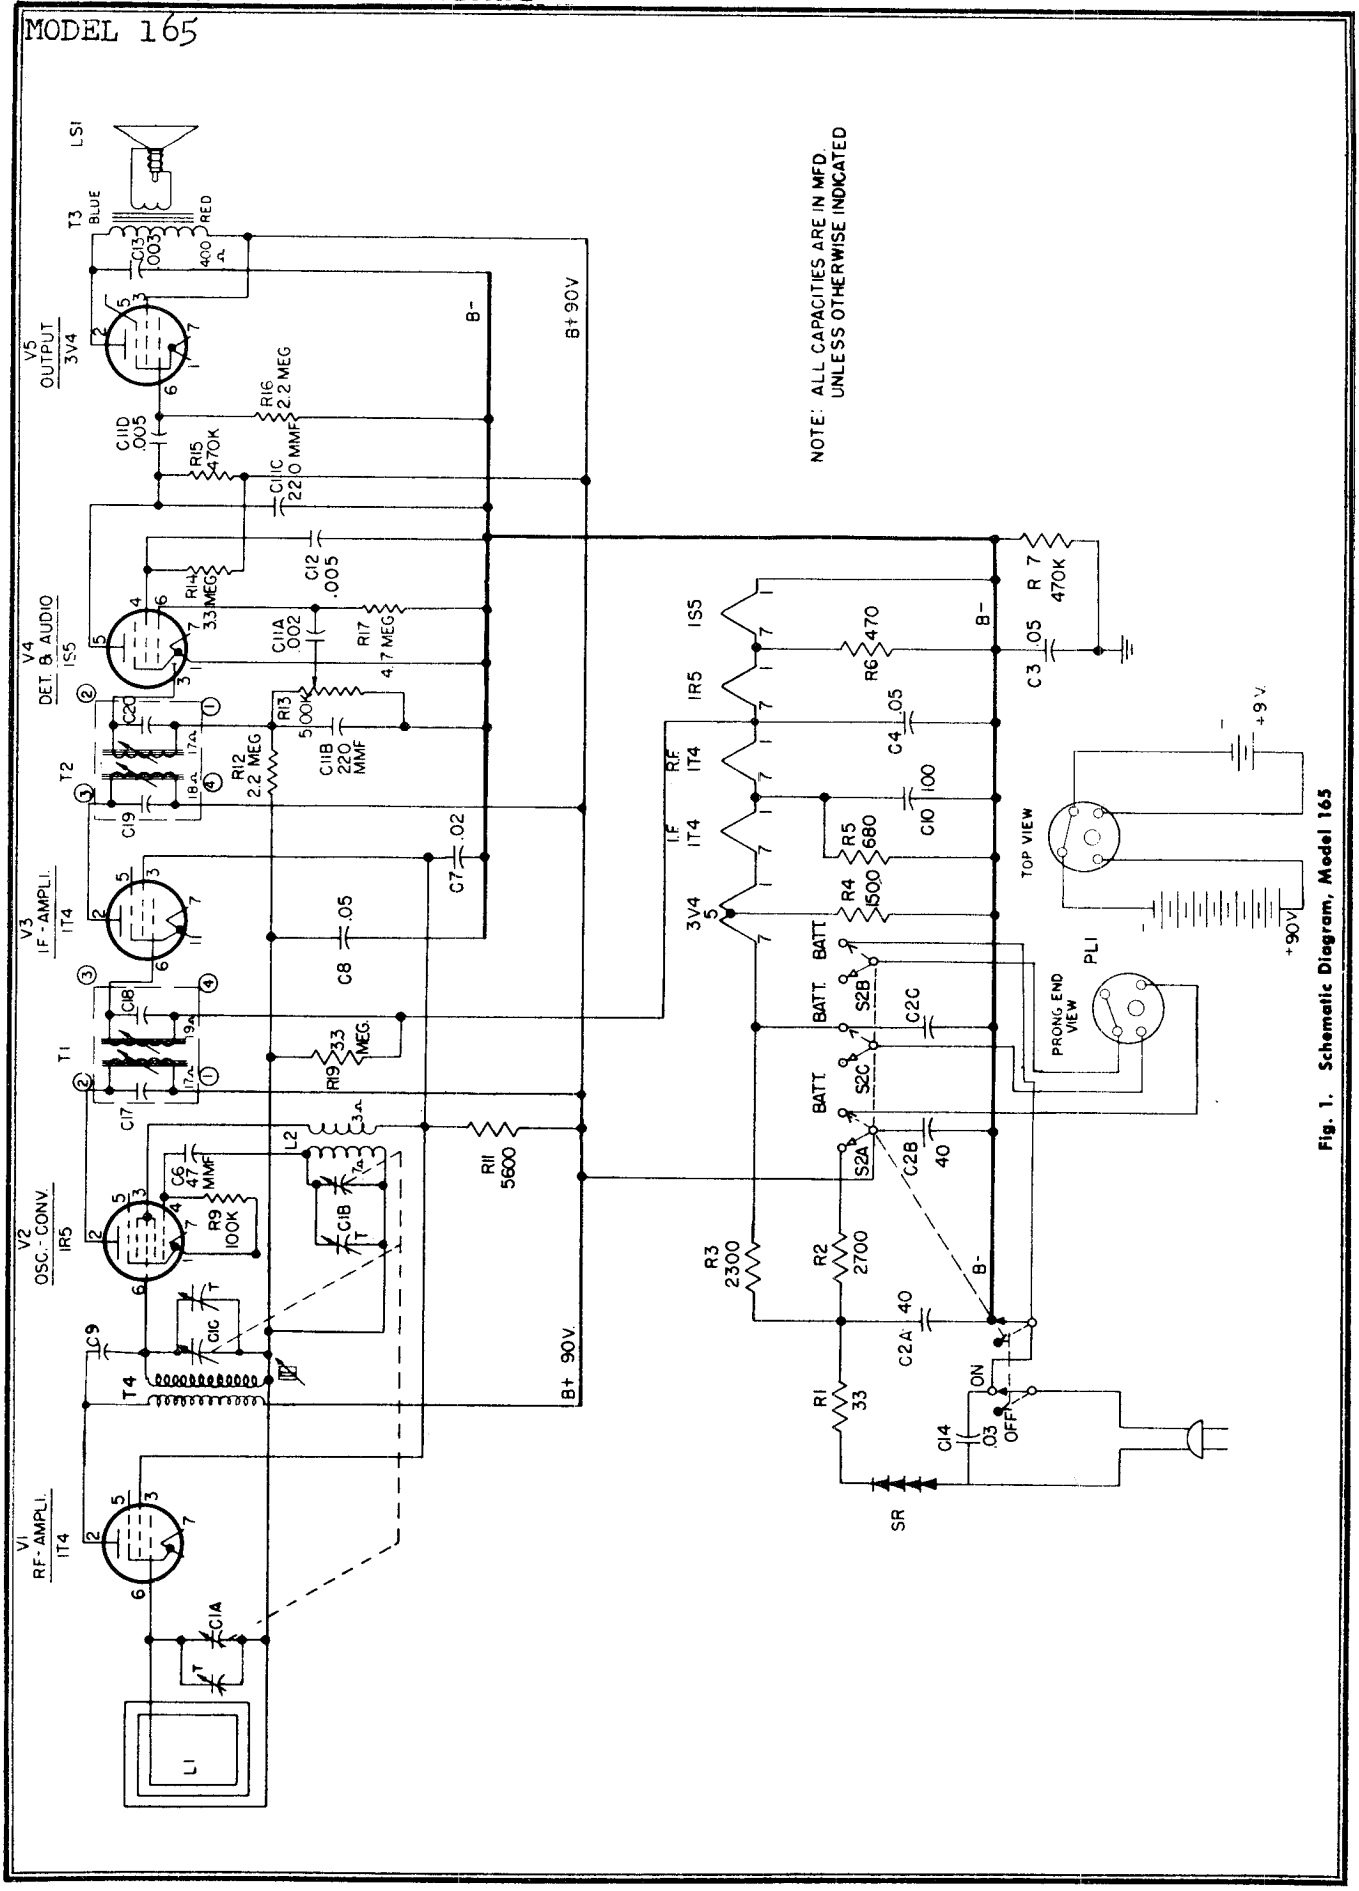

Fig. 1. Schematic Diagram, Model 165

©John F. Rider

(3)

D-C voltage developed across oscillator grid resistor (R9) averages −8 volts at 1000 kc with respect to B−.

(4) HUM

The hum voltage measured at the primary of the output transformer should not exceed 0.4 volts. This measurement should be made with an a-c voltmeter of a sensitivity of 20,000 ohm/volt in series with .5 mf. capacitor.

(5) SOCKET PIN VOLTAGES.

Figure 4 shows voltages from all tube pins to B−. Voltage readings much lower than those specified may help localize defective components or tubes.

(6) MULTIPLE CERAMIC CAPACITOR (K68J128).

This multiple capacitor unit is of the ceramic capacitor type and contains five capacitors C11A, B, C, D and C12. This unit, RCW-3015, is illustrated in Figure 5 for lead identification. If during service the ceramic capacitor unit is found to be defective, the entire unit may be replaced by the identical part, RCW-3015, or the defected section may be located and disconnected from the receiver circuit and the equivalent single components used in its place.

GENERAL INFORMATION

The Model 226 is a five-tube (plus rectifier tube) table model a-c or d-c superheterodyne Standard AM Broadcast receiver. It is equipped with an efficient built-in antenna loop which is connected to an R-F amplifier stage providing increased gain. This receiver employs automatic volume control, beam power output and an oversize permanent magnet loudspeaker.

ELECTRICAL CIRCUIT ALIGNMENT

EQUIPMENT REQUIRED

1. Test oscillator, tone amplitude-modulated.
2. A-C output meter, 1½ volts full scale.
3. .05 mfd., paper capacitor.
4. Insulated screwdriver.
5. Coupling loop for test oscillator (see text).
6. Isolation power transformer.

ALIGNMENT PROCEDURE

The alignment steps are given in the table form of the Alignment Chart. Adjustment trimmers are shown in the illustration of Fig. 3.

1. The chassis is removed from the cabinet with the antenna loop and back attached and the speaker leads reconnected.
2. An isolation transformer should be used for the receiver power source when aligning or servicing AC-DC receivers, to prevent short circuiting of equipment and shock hazard.
3. The output meter is connected across the terminals of the loudspeaker voice coil.
4. The receiver volume control should be turned to maximum and test oscillator signal output attenuated during alignment to develop not more than 1¼ volts output meter reading at the loudspeaker.
5. For i-f alignment, the high side of the signal generator output cable should be connected through a .05 mfd. paper capacitor to the points indicated in the Alignment Chart. The low side of the output cable is connected to the receiver chassis.
6. To align the oscillator and r-f trimmers, the signal generator output is inductively coupled to the radio loop, L1, by connecting a four-turn, six-inch diameter loop of bell wire across its output terminals and then locating the loop about one foot from the radio loop antenna. To prevent possible errors in comparative peak readings, the position of signal generator loop with respect to the radio loop antenna should not be changed during measurement.

CAPACITORS C10, 11, 12 AND 13

UNIT K67J836

The lead connections for the four-section ceramic capacitor unit containing C10, C11, C12 and C13 are identified from the illustration of Fig. 2.

REPLACEMENT

The four-section unit is catalogued RCW-3013 in the parts list for direct replacement. However, any single section may be replaced by one of the single unit capacitors catalogued for the respective capacitor symbol. These items are: UCC-036, C11; UCC-039, C13; and UCU-1036, C10 or C12.

MODEL 226 REPLACEMENT PARTS LIST

CAT. NO.	SYMBOL	DESCRIPTION
		UNIVERSAL REPLACEMENT PARTS
UCC-036	C11	CAPACITOR—.002 mf., 600 v., paper (alternate replacement for RCW-3013)
UCC-039	C13	CAPACITOR—.005 mf., 600 v., paper (alternate replacement for RCW-3013)
UCC-041	C14	CAPACITOR—.02 mf., 600 v., paper
UCC-045	C16, 17, 18, 19	CAPACITOR—.05 mf.; 600 v., paper
UCU-020	C5	CAPACITOR—47 mmf., mica
UCU-028	C4	CAPACITOR—100 mmf., mica
UCU-1036	C10, 12	CAPACITOR—220 mmf., mica (alternate replacement for RCW-3013)
URD-009	R12	RESISTOR—22 ohms, ½ w., carbon
URD-029	R1, 10	RESISTOR—150 ohms, ½ w., carbon
URD-065	R2	RESISTOR—4700 ohms, ½ w., carbon
URD-081	R3, 4	RESISTOR—22,000 ohms, ½ w., carbon
URD-113	R8, 9, 13	RESISTOR—470,000 ohms, ½ w., carbon
URD-129	R5	RESISTOR—2.2 meg., ½ w., carbon
URD-137	R7	RESISTOR—4.7 meg., ½ w., carbon
URF-053	R11	RESISTOR—1500 ohms, 2 w., carbon
UOP-577	LS	LOUDSPEAKER—
		SPECIALIZED REPLACEMENT PARTS
RAB-108	L1	CABINET BACK—With antenna loop
RAU-311		CABINET—Brown cabinet (plastic)
RCE-050	C15A, B	CAPACITOR—50 mf., 150 v.; 50 mf., 150 v.; dry electrolytic
RCT-036	C1A, B, C2, 3	CAPACITOR—Two-section tuning capacitor with trimmers
RCW-3013	C10, 11, 12, 13	CAPACITOR—220 mmf., .002 mf., 220 mmf., .005 mf. four section, ceramic (see UCC-036, UCC-039, UCU-1036)
RDC-032		CORD—Bulk dial cord
RDK-181		KNOB—Volume or tuning control knob
RDP-049		POINTER—Dial scale pointer
RDS-089		DIAL SCALE
RHC-017		CLIP—Mounting clip for oscillator coil L2
RHG-018		GROMMET—Cushion mounting for tuning capacitor C1A and C1B
RHH-004		SNAP FASTENER—Holds loop back to cabinet
RHJ-005		SPACER—Spacer bushing for mounting tuning capacitor
RHM-039		CLIP—Clip for pilot light
RJC-004		CONNECTOR—Antenna loop lead connecting clip
RJS-003		SOCKET—Tube socket
RJS-096		SOCKET ASSEMBLY—Pilot light socket
RLC-090	L2	COIL—Oscillator coil
RMS-120		SPRING—Dial cord tension spring
RMX-149		SHAFT AND BUSHING—Tuning shaft and mounting bushing
RRC-077	R6, S1	POTENTIOMETER—500,000 ohms; volume control and switch S1
RTL-092	T2	TRANSFORMER—First i-f transformer
RTL-093	T3	TRANSFORMER—Second i-f transformer
RTO-075	T1	TRANSFORMER—Audio output transformer
RWL-009		POWER CORD—A-c power cord and plug

Width	31⅝ in.	31⅝ in.
Depth	16 7/16 in.	16 7/16 in.

ELECTRICAL

Voltage	105–125
Frequency	60 cps
Wattage (Radio)	65 watts
Wattage (Phono)	80 watts

OPERATING FREQUENCIES

AM	540–1620 kc
FM	88–108 mc

INTERMEDIATE FREQUENCIES

AM	455 kc
FM	10.7 mc

POWER OUTPUT

Undistorted	3.0 watts
Maximum	5.0 watts

LOUDSPEAKER

Type	Alnico permanent magnet
Outside Diameter of Cone	12 inches
Voice Coil Impedance at 400 cycles	3.2 ohms

TUBE COMPLEMENT

(V1) Converter	6BE6
(V2) R-F and 1st FM-IF Amplifier	6BA6
(V3) Second FM and 1st AM-IF Amplifier	6BA6
(V4) FM Limiter	6AU6
(V5) AM Detector, FM Discriminator, and Audio Amplifier	6T8
(V6) Power Output	6V6
(V7) Rectifier	5Y3GT
(V8) Phono Preamplifier	6SC7

PHONOGRAPH PICK-UP

Type	Variable reluctance
D-C Resistance	340 ohms

ANTENNA

AM	Built-in loop or outside antenna
FM	Power cord antenna, or 300 ohm FM dipole antenna

GENERAL

Models 329 and 330 are combination AM and FM receivers and phonograph. Model 329 is housed in a dark mahogany cabinet, while Model 330 is housed in a blonde cabinet.

The P15 phonograph in Models 329 and 330 is designed to play either automatically or manually 45 rpm seven-inch records 33⅓ rpm, 7-, 10- or 12-inch records or the standard 78 rpm 10- or 12-inch records. The pickup has a stylus selector to select either a 3 mil radius stylus for playing standard or wide groove records or a 1 mil radius stylus for playing the 33⅓ LP, 45 rpm records.

For service information and replacement parts on the P15 record changer, refer to ER-S-P15.

These models are designed to operate either from built-in antennas or from an external AM antenna or FM dipole antenna. On AM it is merely necessary to connect an external antenna to the terminal screw marked "Antenna." On FM, to operate the receiver from the built-in power line antenna, it is necessary to connect the green wire coming out of the rear of the chassis, to the left-hand terminal screw of the antenna terminal strip. For operation from a 300-ohm FM dipole, remove this green wire from the terminal and connect the 300-ohm transmission line to the terminals marked "DIPOLE."

On AM, the limiter tube, V4-6AU6, is not used. The i-f signal is fed from T5 to the detector V5.

On FM, the set uses a reflex circuit, the Armstrong type discriminator, and a special limiter circuit.

SERVICE INFORMATION—Alignment, socket voltages, dial stringing, tube and trimmer location, etc., refer to ER-S-324.

REPLACEMENT PARTS—Refer to replacement parts list of ER-S-324 except for those parts lised below.

Cabinet and knobs for Model 329 are the same as those listed for Model 324. Cabinet and knobs for Model 330 are the same as those listed for Model 328.

Cat. No.	Symbol	Description

MODELS 92-523,
92-524, 92-525, 92-526

GENERAL INFORMATION

TYPE -AC-DC table model superheterodyne with loop antenna

TUNING RANGE - 535 to 1620 Kc

IF FREQUENCY - 455 Kc

TUBE COMPLEMENT - 12BE6 - Converter
12BA6 - IF Amplifier
12AT6 - Detector, AVC & 1st AF Amp
50C5 - Power Amplifier
35W4 - Rectifier

POWER SUPPLY - 117V AC (50 to 60 cycles) or DC, 30 watts

CAUTION: Never connect antenna or chassis to water pipe, radiator or other ground.

ALIGNMENT

If AC power is used, use an isolation transformer between power line and receiver. If isolation transformer is not available, connect low side of signal generator to B- through .1 mf capacitor.

Connect low range output meter across speaker voice coil and set volume control at maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing signal generator output as stages are brought into alignment. Use a small fibre screwdriver for aligning IF & diode transformers.

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	POINTER SET TO	ADJUST	REMARKS
IF ALIGNMENT						
1.	.1 mf	Rear stator of tuning cap	455 Kc	Gang opened	1, 2, 3 & 4	Adjust for maximum.
RF ALIGNMENT						
2.	"	"	1620 Kc	"	5	Adjust for maximum.
3.	None	Radiation loop*	1400 Kc	Tune for maximum	6	Adjust for maximum.

*Connect generator output to 5" diameter, 3 turn loop & couple to receiver loop. Keep loops at least 12" apart.

MODELS EX-102, EX-103

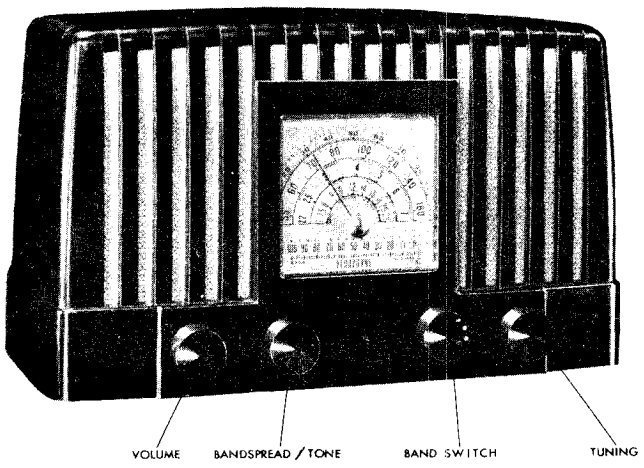

Fig. 1. Front view of Model EX-102 showing controls.

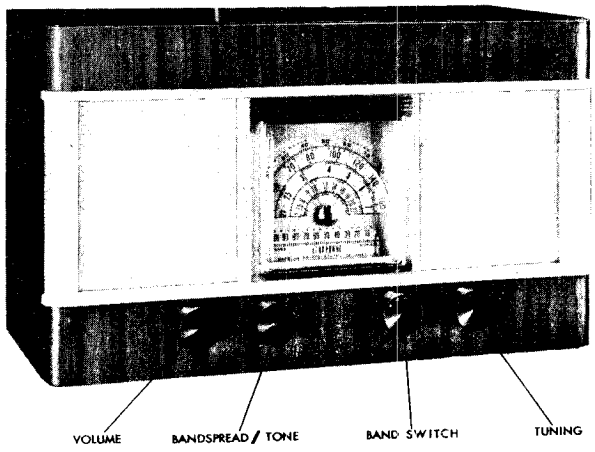

Fig. 2. Front view of Model EX-103 showing controls.

GENERAL: Models EX-102 and EX-103 are five tube, table model superheterodyne radio receivers, capable of receiving broadcast and short wave stations in three bands as follows: Band No. 1 (broadcast band)—540 to 1625 kc; Band No. 2 (short wave range 1)—2.2 to 7.1 mc; Band No. 3 (short wave range 2)—6.9 to 22 mc. Models EX-102 and EX-103 are electrically identical, but have different cabinets. Both models have ballast tubes which permit operation from 210 to 250 volts a-c/d-c as well as from 105 to 125 volts a-c/d-c power source. Both models have a built-in antenna plus provision for external antenna and ground system. Power drain is 25 watts at 117 volts for both models.

TUBE TYPES AND THEIR FUNCTIONS: type 12SA7GT/G—mixer/oscillator; type 12SK7GT/G—first i-f amplifier; type 12SQ7GT/G—detector, avc, and first audio amplifier; type 35L6GT/G—audio power amplifier; type 35Z5GT/G—power rectifier.

CONTROLS AND THEIR USE: VOLUME control—turn clockwise to turn on receiver and adjust volume; BANDSPREAD/TONE control—turn clockwise to operate bandspread and adjust tone; BANDSWITCH control—turn knob from left to right, as indicated by dots on knob, for bands 1, 2 or 3; TUNING control—turn knob clockwise or counterclockwise to locate desired station.

DETAILED SERVICE INFORMATION

IF FREQUENCY	RECEIVER OVERALL SELECTIVITY	IMAGE RATIO	*RECEIVER OVERALL SENSITIVITY	AUDIO OUTPUT
455kc	8.5kc wide at 6db down 16kc wide at 20db down 32kc wide at 40db down (for 500 milliwatt output)	65:1 at 1000kc (loop) 20:1 at 2.5mc (ant.) 8:1 at 7.0mc (ant.) 6:1 at 15.0mc (ant.) 3:1 at 20.0mc (ant.)	117 microvolt at 1000 kc 200 microvolt at 2.5 mc 140 microvolt at 6mc 322 microvolt at 8mc 115 microvolt at 20mc	0.8 watt with less than 10% distortion

*Readings for 500 milliwatt constant output. Speaker disconnected and replaced with a 3.2 ohm load resistor. Signal from generator modulated 30% at 400 cycles.

HOW TO RESTRING DIAL CORDS

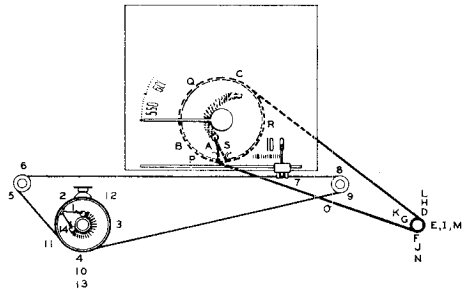

Fig. 3. Dial cable stringing procedure; main tuning is indicated by letters, and band spread tuning is indicated by numbers.

To restring the main tuning dial cord, cut a 25″ length of 18 lb test dial cord and tie one end to the tension spring of the main tuning capacitor drive pulley at position "A" on the diagram. Following the letters "A" through "S", wind the cord on the pulley and knob drive shaft. At position "S", stretch the tension spring and tie the cord securely. Cut off the excess cord. Note that three turns are wound on the knob drive shaft.

To restring the bandspread tuning dial cord, cut a 30″ length of the dial cord and follow the procedure as explained above, except start at position "1" on the diagram and proceed through position "14". Then turn knob pulley maximum clockwise, slide pointer to 100 and insert cord in clip on pointer. Note that the knob pulley has two turns.

ALIGNMENT INSTRUCTIONS

EQUIPMENT:

1. Signal Generator capable of ranges indicated in the ALIGNMENT CHART below, including a 400 cycle audio modulator.
2. Standard RMA dummy antenna which consists of a 200 mmf capacitor in series with a 20 uh r-f choke which is shunted by a 400 mmf capacitor in series with a 400 ohm carbon resistor.
3. Output meter capable of handling 1 watt of audio power.
4. Non-metallic screw driver.

CONNECTIONS: Connect signal generator "cold" lead to negative return of receiver circuits, NOT to chassis. The "hot" lead is connected as indicated in the chart below.

Connect the output meter across the voice coil of the speaker and adjust the meter for 3 ohm impedance.

CAUTION: *See that the ballast tube is in the proper position with respect to the power line voltage.*

CONTROL SETTINGS: After allowing the receiver to warm up about ten minutes, set the controls as follows: VOLUME control full clockwise; BANDSPREAD tuning control at "0"; BANDSWITCH and main TUNING controls as indicated in the following chart.

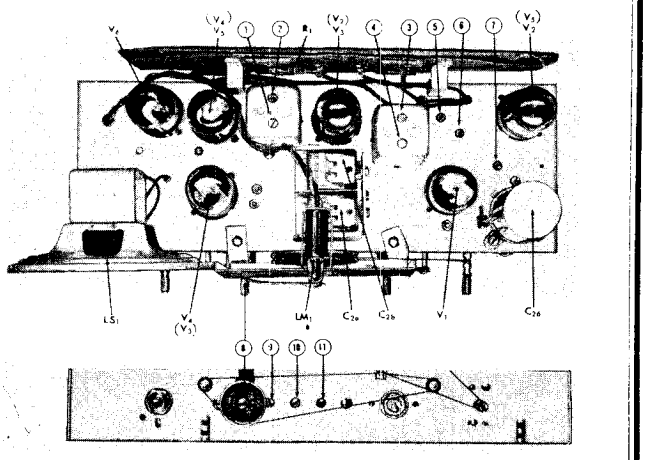

Fig. 6. Models EX-102 and EX-103, view showing alignment points.

DUMMY ANT. IN SERIES WITH SIG. GENERATOR	CONNECTION OF SIG. GENERATOR OUTPUT TO RECEIVER	SIGNAL GEN. FREQUENCY SETTING	BAND SWITCH SETTING	RECEIVER DIAL SETTING	ADJUST SLUG PADDER, OR TRIMMER NO.	TRIMMER DESCRIPTION	TYPE OF ADJUSTMENT MAKE ADJUSTMENT FOR:	STEP NO.

Standard RMA Dummy	"A" on antenna terminal strip	6mc 6mc	Range 2	6mc 6mc	9 7	Osc. trimmer Antenna shunt trimmer	Maximum output Maximum output	10 11

NOTE: Bandspread indicator MUST be at ZERO when making all adjustments.

Band 2 oscillator trimmer (9) must be set AFTER bandspread trimmer (8) (Range 3 oscillator trimmer) is aligned.

†Rock the main tuning capacitor slightly (turn back and forth slowly) when making these adjustments.

*Standard RMA dummy antenna consists of a 200mmf condenser in series with a 20uh r-f choke, the choke being shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

**Connect Sig. Gen. ground lead to receiver negative return, not to chassis. This applies only for I-F adjustment.

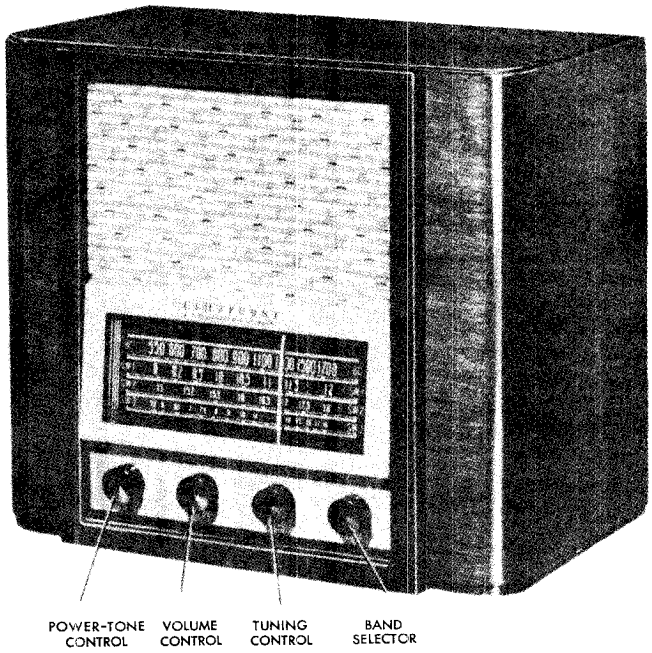
MODELS EX-104, EX-106

GENERAL

Tubes	Five plus rectifier
Speaker	6-inch P.M.
Speaker V.C. Impedance	3.2 ohms
Headset Output	High Impedance
Antenna	
EX-104	Built-in cabinet antenna. Provisions for external long wire antenna.
EX-106	Provision for an external long wire antenna only. Supplied with shielded lead.
Phono Input	High Impedance
Tuning	Manual
Tuning Range	Broadcast 540 kc -1700 kc Shortwave A - 2.2 mc - 7.5 mc Shortwave B - 7 mc - 22 mc Shortwave C - 9 mc - 12 mc
Intermediate Frequency	455 kc
Power Supply	
EX-104	105/125 V. or 210/250 V. 60 cycles AC
EX-106	6.8 V. DC @ 7 amperes

Note - A battery charger must not raise the supply voltage above 7.5 volts with the receiver operating.

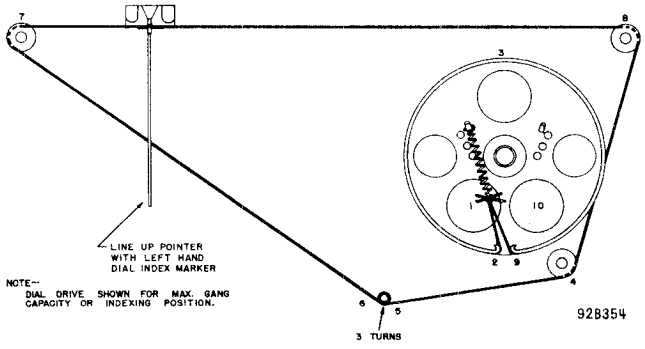
Power Consumption	
EX-104	55 Watts
EA-106	48 Watts



RESTRINGING DIAL CORD

Restring the dial drive with 30 lb. test dial cord. Tie one end to the tension spring and follow the sequence outlined in Fig. 1. Stretch the tension spring and tie the end of the cord securely to the spring as shown.

Set the tuning condenser at maximum capacity (closed), attach the pointer to the string and line it up with the left hand index mark on the dial scale.



LINE UP POINTER WITH LEFT HAND DIAL INDEX MARKER
NOTE— DIAL DRIVE SHOWN FOR MAX. GANG CAPACITY OR INDEXING POSITION.
3 TURNS
928354

Fig. 1. Dial cable stringing procedure.

REPLACING LAMPS

Replace dial lamps with 6-8 V. Mazda #44 (Blue bead) pilot lamps or equivalent. To gain access to defective dial lamps, the chassis must be removed from the cabinet. Remove the four knobs (pull straight off the shafts), four mounting screws located at the bottom of the cabinet and disconnect the speaker plug to separate the chassis from the cabinet. On Model EX-104 the cabinet antenna lead must also be disconnected.

REPLACING FUSES

The Model EX-106 uses a battery cable fuse. Make replacements with a 15-ampere type 3AG fuse.

ALIGNMENT PROCEDURE:

Since all connections and adjustments necessary for alignment are accessible from the top of the chassis, the receiver may be aligned without removing the chassis from the cabinet. The output transformer is located on the under side of the chassis, hence, the output meter connection should be made at the speaker socket. (3-ohm V.C.).

All alignment adjustments are made at maximum volume. Refer to the alignment chart for the dial and band switch settings.

The standard RMA dummy antenna specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

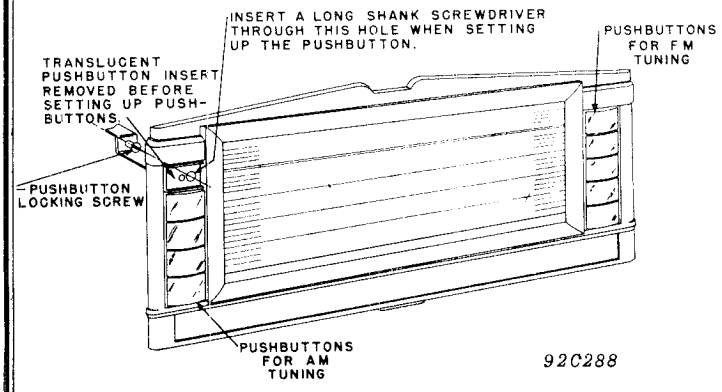
MODELS EC-403,
EC-404, Rev.

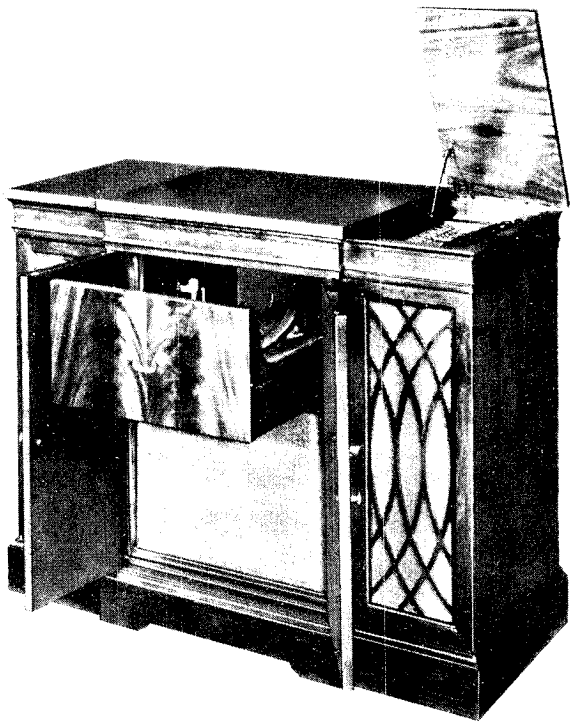
GENERAL

Tubes	Fourteen plus rectifier
Speaker	15" PM or twin 10" PM
Antennas	Built-in loop, "AM" Built-in dipole, "FM"
Provision for external Antennas.	
Tuning	Manual and mechanical push-button 5 P.B. for "AM" and 5 P.B. for "FM".
Tuning Range	(BC) 540 kc - 1700 kc (A) 15 mc - 18 mc (B) 9 mc - 12 mc (C) 5.8 mc - 18 mc (FM) 88 mc - 108 mc
Intermediate Frequency	455 kc/10.7 mc
Power Supply	105-125 V. 60 cycle AC
Power Consumption	180 watts



INSERT A LONG SHANK SCREWDRIVER THROUGH THIS HOLE WHEN SETTING UP THE PUSHBUTTON.
PUSHBUTTONS FOR FM TUNING
TRANSLUCENT PUSHBUTTON INSERT REMOVED BEFORE SETTING UP PUSH-BUTTONS.
PUSHBUTTON LOCKING SCREW
PUSHBUTTONS FOR AM TUNING
92C288

Fig. 1. View showing pushbutton setup.



INSERTING CALL LETTERS

1. Slide out metal insert from translucent insert assembly. (See Fig. 2).
2. Insert call letter tab.
3. Replace metal insert.
4. Replace translucent insert assembly into push-button.

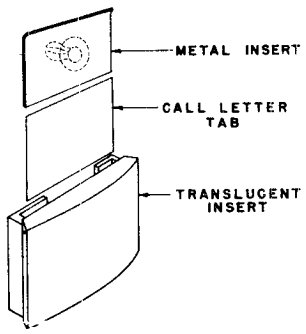


Fig. 2. Inserting call setters

BUTTON SETTING

Insulate the muting switch contacts before setting the lower group of AM pushbuttons. See Fig. 3.

1. Select any one pushbutton.
2. Pull translucent insert straight out.
3. Insert screw driver blade through large hole of push-button into slot of locking screw. (See Fig. 1).
4. Loosen locking screw about one-half turn. (Not more than one full turn.)
5. With pushbutton depressed, carefully tune in desired station with the manual control and tighten the locking screw.
6. Replace the translucent insert with the proper station call letters inserted.

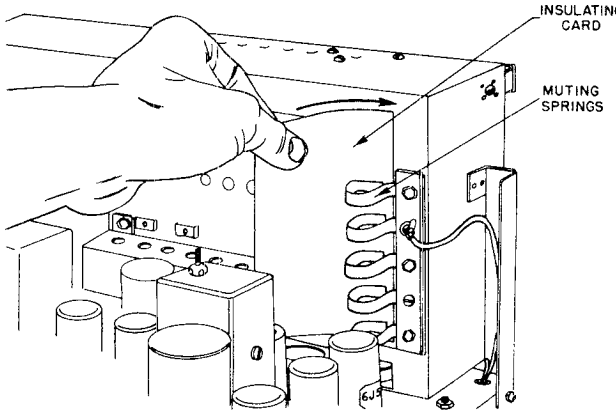

Fig. 3. Insulating the muting switch contacts.

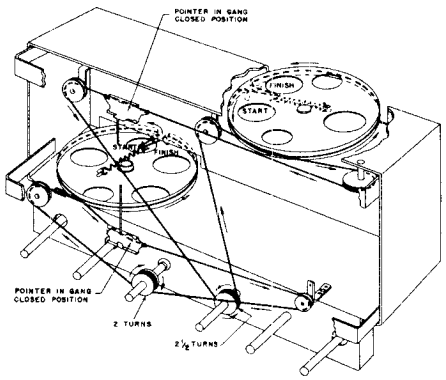
MODELS EC-403, EC-404, Rev.

DIAL CORD STRINGING INSTRUCTIONS

To restring either the "FM" or "AM" dial drive systems, cut a five foot length of 9 lb. test dial cord and follow the stringing procedure illustrated in Fig. 4. Note that the start and finish of both drives are located at the tension spring on the drum.

Index the pointer carriage as described under ALIGNMENT PROCEDURE.



92C278

Fig. 4. Dial cable stringing procedure.

ALIGNMENT PROCEDURE

Removal of the receiver chassis from the cabinet requires the use of other calibration means than the dial glass. Calibration strips mounted on the pointer rails are provided for alignment purposes.

To use these calibration strips, it is necessary to remove the dial plate (brown metal cover) in the following manner:

1. Remove dial pointers. Pull them straight out of their spring clips.
2. Remove the two dial lamp sockets.
3. Remove dial plate fastened to the chassis with seven sheet metal screws.

With the variable condensers fully meshed, the right hand side of the pointer carriage will be indexed to zero on the calibration strips. Refer to Fig. 5.

The receiver is equipped with AUTOMATIC FREQUENCY CONTROL on the FM band to compensate for mechanical variations in the pushbutton mechanism. The correction factor is approximately 5 times: AFC takes hold 100 kc before the station frequency is reached and releases before tuning 450 kc beyond the station frequency when receiving a 0.1 volt signal.

The standard RMA dummy specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

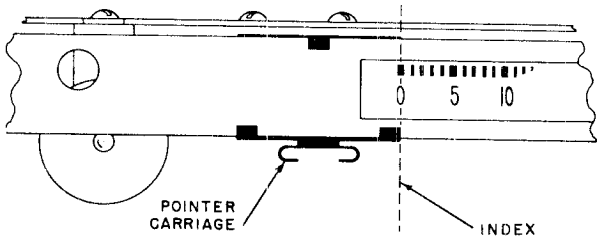


Fig. 5. Calibration strip detail.

ALIGNMENT CHART

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Pos.	Radio Tuned To	Cal. No.	Adjust	Remarks
1	0.01 mfd. cap.	To stator plates of center section of AM tuning cap.	455 kc	"BC"	1000 kc	55	S3, S6, S2, S5, S1 & S4	Adjust for max. output TREBLE tone control set at No. 1.

SOURCE VOLTAGE	FUSE (F_2) RATING
6 V.	10 A.
12 V.	5 A.
32 V.	2 A.

GENERAL

Tubes . . . . . .Nine plus rectifier
Speaker . . . . . .5-inch P.M.
Speaker V.C. Impedance. . .3.2 ohms
Headset Output. . . . . .Low Impedance
Antenna . . . . . .Provision for external antenna
Tuning . . . . . .Manual
Tuning Range

Range	Frequency	Reception
A	200 kc - 300 kc	Fixed Frequency
B	2.0 mc - 3.0 mc	" "
C	2.0 mc - 3.0 mc	" "
1	132 kc - 405 kc	General Coverage
2	485 kc - 1530 kc	" "
3	1450 kc - 4550 kc	" "
4	4.2 mc - 13.0 mc	" "

Intermediate Frequency. . .445 kc
Power Supply . . . . . .105-125 V. DC or 60 cycles AC. Provisions for 6 V., 12 V., 32 V. DC operation.
Power Consumption . . . .30 Watts

6 V., 12 V., AND 32 V. OPERATION

The Model S-51 Receiver may be operated from a 6 V., 12 V., or 32 V. source by inserting the correct power supply adapter unit. This adapter unit is plugged into the dual socket located on the top of the receiver chassis. Remove the jumper plug before inserting the low voltage adapter unit. One adapter unit is available for each of the above source voltages.

DC Source Voltage	Adapter Unit Part No.	Identification Stamp	Use Cable No.	Fuse Rating
6 Volts	1X629	6 VOLTS	87B1661	10 amperes
12 Volts	1X630	12 VOLTS	87B1661-1	5 amperes
32 Volts	1X631	32 VOLTS	87B1661-2	2 amperes

When operating the receiver with the adapter, the power cable normally used for 117 V. AC/DC operation is replaced with the power cable supplied with the adapter unit and plugged into the same receptacle on the receiver. Connect the fused power cable lead to the "hot" side of the DC source and the unfused lead to the ground or "cold" side of the supply. Disregard polarity of the DC supply as this is taken care of by a reversing switch located on the back side of the adapter unit.

RESTRINGING DIAL CORD

To restring the general coverage tuning dial cord, cut a 24-inch length of 30 lb. test dial cord and tie one end to the tension spring of the main tuning capacitor drive pulley at position "1" on the diagram. Follow the numbers "1" through "7" and at position "7" stretch the tension spring and tie the cord securely.

REPLACING LAMPS

Refer to Fig. 7. for location of the two dial lamps used in the receiver. Defective lamps may be replaced through the cabinet cover. Replace defective lamps with 6-8 V. Mazda #47 (Brown bead) lamps or equivalent.

REPLACING FUSES

A line fuse protects the receiver when operating from a 105-125 V. AC/DC source. This fuse is accessible at the rear apron of the receiver chassis. Replace defective fuses with type 3AG fuses with a one ampere rating.

Protective fuses for 6 V., 12 V., and 32 V. operation are located in the power cable. Refer to the paragraph on low voltage operation for fuse ratings. Replace defective fuses with the type 3AG body size.

CAUTION - Do not replace defective fuses with one of higher current rating than specified. Use the correct fuse and avoid costly repairs.

FIXED FREQUENCY CHANNEL ADJUSTMENTS

Adjustment of the fixed frequency channels for code and radio telephone reception in the 200 kc to 300 kc or 2000 kc to 3000 kc ranges is accomplished as described below. A total of three fixed frequency channels are available, one channel in the 200 kc to 300 kc range and two channels in the 2000 kc to 3000 kc range.

Set the band or range switch at "A" for a channel in the 200 kc to 300 kc band or either "B" or "C" for a channel in the 2000 kc to 3000 kc band.

Lift the hinged cabinet cover and with a small screwdriver, adjust the screws identified as "Ao", "Am", and "Aa" for the "A" band or "Bo", "Bm", and "Ba" for the "B" band, etc. Refer to Fig. 2. Make the adjustments in the order "O" "M" "A" (Oscillator, Mixer and Antenna),

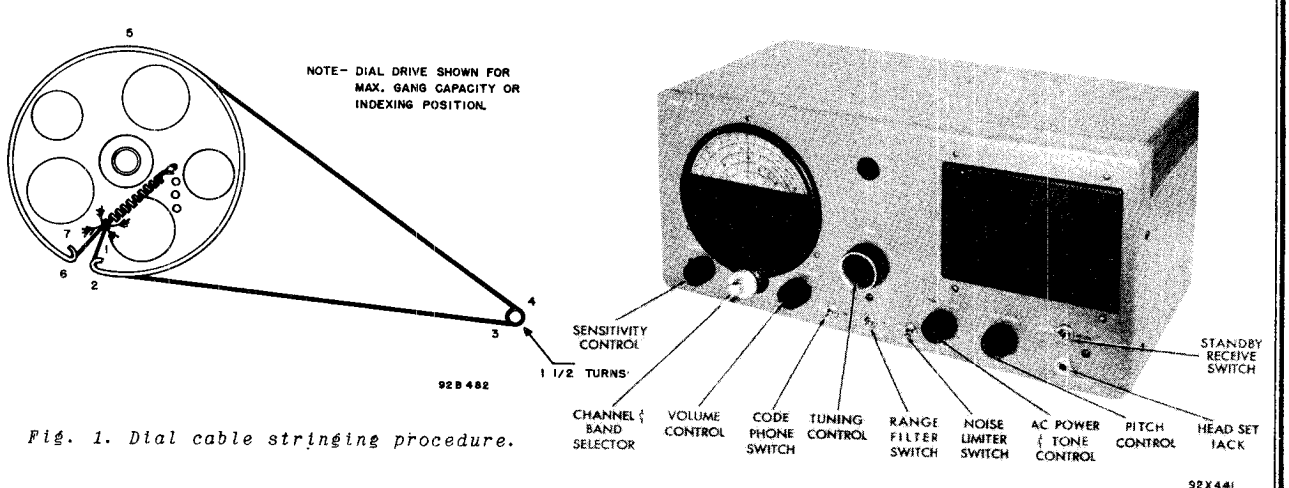

Fig. 1. Dial cable stringing procedure.

MODEL S-51

ALIGNMENT CHART

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Setting	Receiver Dial Setting	Adjust	Remarks
1	.1 mfd. If an isolation transformer is not used, change dummy ant. to .001 mfd. to reduce hum modulation	High side to stator plates in center section of tuning gang; low side to chassis.	445 kc	"2"	Tuning cap. fully open	S1,2,3, 4,5,6	Adjust for maximum audio output at speaker voice coil. Use just enough signal generator output to obtain a 50 mw audio level.
2	See step 1.	See step 1	445 kc (No modulation)	"2"	See step 1	S7	With the CW/AM switch set at CW remove the pitch control knob and adjust S-7 for zero beat. Replace the knob with the dot in the center position.
3	Std. RMA dummy	High side to "A1" on antenna strip; low side to chassis. Jumper connected between "A2" and "G"	350 kc	"1"	350 kc	*A,B,C	Maximum output as in step 1.
			150 kc		150 kc	*D	
4	Std. RMA dummy	See step 3	1400 kc	"2"	1400 kc	*E,F,G	Maximum output as in step 1.
			600 kc		600 kc	*H	
5	Std. RMA dummy	See step 3	4 mc	"3"	4 mc	*I,J,K	Maximum output as in step 1.
			1800 kc		1800 kc	*S8	
6	Std. RMA dummy	See step 3	12 mc	"4"	12 mc	*L,M,N	Maximum output as in step 1.
			5 mc		5 mc	*S9	

*Note - Calibration adjustments.

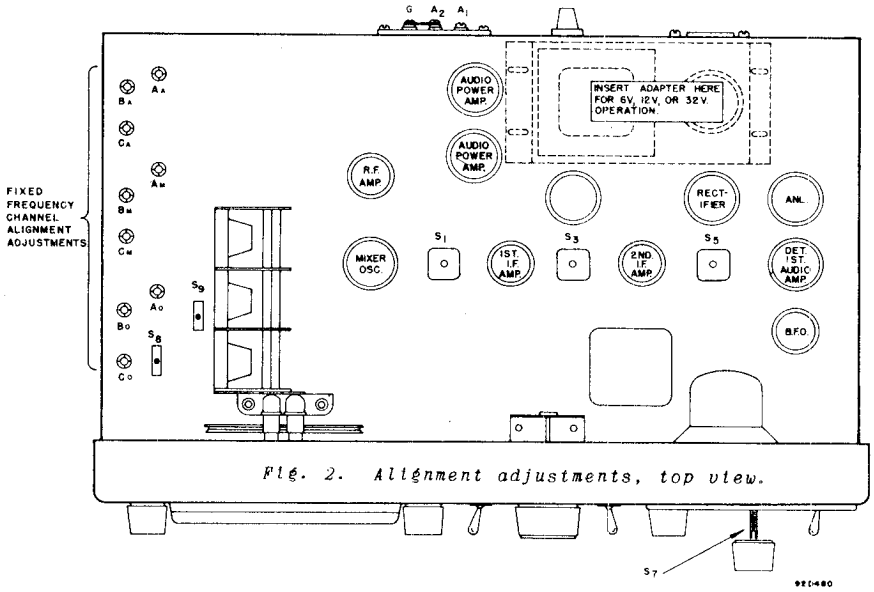

Fig. 2. Alignment adjustments, top view.

TONE	Set at HIGH
STANBY-RECEIVE	Set at RECEIVE

For the settings of the remaining controls, refer to the alignment chart.

It will be necessary to remove the receiver chassis from the cabinet to make some of the alignment adjustments. The chassis is held in the cabinet by three screws along both the bottom edge of the front panel and the rear of the cabinet, and two screws on either side of the front panel.

The standard RMA dummy mentioned in the alignment chart consists of a 200 mmf. condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

adjusting the oscillator screw ("O") as you would normally tune in a station and adjusting the "M" and "A" screws for maximum volume. When setting up a channel for code reception, set the PITCH CONTROL at mid position and tune the "O" adjustment for zero beat. The PITCH CONTROL may then be set for the desired pitch when copying code signals on the particular fixed frequency channel.

ALIGNMENT PROCEDURE

Set the following controls before alignment:

SENSITIVITY	Set at maximum
VOLUME	Set at maximum
CW/AM switch	Set at AM (see step 2)
RANGE FILTER	Set at OFF
NOISE LIMITER	Set at OFF

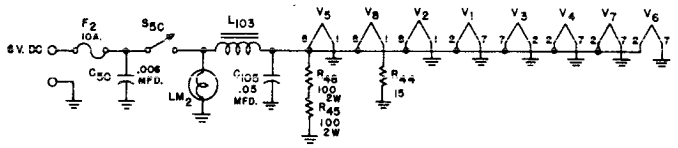
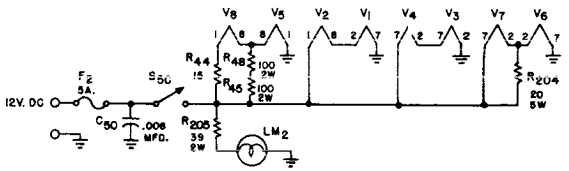
NOTES—

1. SOCKET VIEWS ARE BOTTOM VIEWS.
2. ALL VOLTAGES ARE MEASURED BETWEEN TUBE SOCKET TERMINALS AND THE ELECTRICAL GROUND BUSS (NOT CHASSIS) WITH ZERO SIGNAL INPUT.
3. LINE VOLTAGE — 117 V. AC (SOCKET VOLTAGE READINGS FOR TUBE V_6 TAKEN WITH A 6V. DC SOURCE AND VIBRAPACK). AC VOLTAGES SHOWN WILL BE DC WHEN OPERATING FROM A 117V. DC SOURCE. HEATER VOLTAGES SHOWN ARE FOR 117V. SOURCE ONLY. FOR HEATER ARRANGEMENTS FOR 6V., 12V. AND 32V. SOURCES SEE CIRCUIT DIAGRAMS IN THIS ILLUSTRATION.
4. ALL VOLTAGES SHOWN ARE DC UNLESS OTHERWISE SPECIFIED.
5. DC VOLTAGES SHOWN WERE MEASURED WITH AN ELECTRONIC VOLTMETER.
6. "NC" — NO CONNECTION. (VOLTAGE SHOWN FOR THIS TERMINAL ONLY WHEN TERMINAL IS USED AS A TIE LUG).
7. ☐ SPACE PROVIDED FOR SERVICE METER READINGS.
9. ALL READINGS TAKEN WITH PLUG POLARIZED SO THAT GROUND BUSS AND CHASSIS ARE AT SAME POTENTIAL WITH THE CHASSIS GROUNDED.
10. STANDBY / RECEIVE SWITCH SET AT RECEIVE; CW/AM SWITCH SET AT AM; NOISE LIMITER SWITCH SET AT OFF.

HEATER CIRCUIT FOR 6V. DC OPERATION



HEATER CIRCUIT FOR 12V. DC OPERATION



HEATER CIRCUIT FOR 32V. DC OPERATION

MODEL S-72

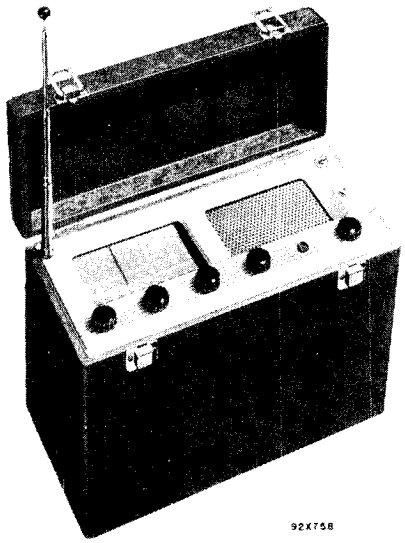
GENERAL

Tubes	Eight plus selenium rectifier
Speaker	5-inch PM
Speaker V.C. Impedance	3.2 ohms (100 ohm headset tap)
Headset Output	For 500 to 5000-ohm phones
Antenna	Loop for band 1 Whip for bands 2, 3 and 4 Provisions for connection to an external antenna
Tuning	Manual

Tuning Range

Band Selector Position	Frequency Range
1.	550 kc - 1600 kc
2.	1500 kc - 4.4 mc
3.	4.5 mc - 11.5 mc
4.	11 mc - 30 mc

Intermediate Frequency	455 kc.
Power Supply	105-125 V. DC/60 cycles AC or Battery Pack
Power Consumption	25 Watts



RESTRINGING DIAL CORD

GENERAL COVERAGE DIAL

To restring the general coverage tuning dial drive, cut a 32-inch length of 30 lb. test dial cord and tie one end to the tie-point "1" shown in Fig. 1. Follow the number sequence "1" through "12" and at position "12" stretch the tension spring and tie the cord securely. Note that the string is wrapped around the drive shaft three and a fraction times for proper traction. Close the gang capacitor and attach the pointer so that it is aligned with the index marks on the left side of the dial scales.

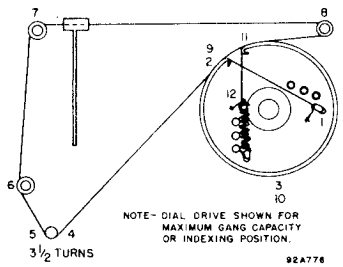


Figure 1. Dial cable stringing procedure, general coverage

BAND SPREAD DIAL

To restring the band spread tuning dial drive, cut a 24-inch length of 30 lb. test dial cord and tie one end to the tension spring in the band spread pulley at position "A" in Figure 2. Turn the pulley counter-clockwise to the stop and string up the drive following the lettered sequence "A" through "E" and at position "E" stretch the tension spring and tie the cord securely.

In cases where the set screw on the band spread pulley has been loosened, set the general coverage dial to the frequency of a signal generator or local short wave station and tune in the signal with the band spread drive shaft. Turn the pulley counter clockwise to the stop, tighten the set screw and attach the band spread pointer and index it at 100 on the band spread dial scale.

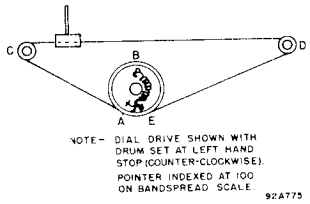

Figure 2. Dial cable stringing procedure, band spread

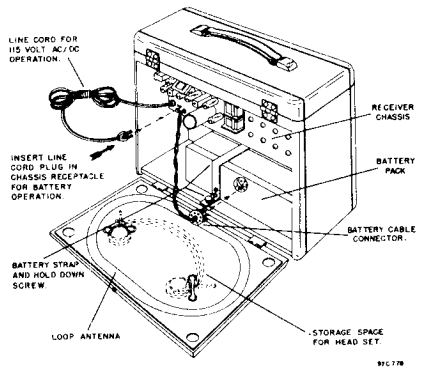
BATTERY REPLACEMENT

A strip of canvas webbing and a hold down screw are used to keep the battery in the cabinet. To replace the battery, disconnect the battery plug and loosen the hold down screw. Refer to Fig. 3.



LINE CORD FOR 115 VOLT AC/DC OPERATION.
RECEIVER CHASSIS
INSERT LINE CORD PLUG IN CHASSIS RECEPTACLE FOR BATTERY OPERATION.
BATTERY PACK
BATTERY CABLE CONNECTOR.
BATTERY STRAP AND HOLD DOWN SCREW
LOOP ANTENNA
STORAGE SPACE FOR HEAD SET.

Suitable replacement packs can be found from the list shown below.

REPLACEMENT BATTERY LIST

Manufacturer	Type No.	Manufacturer	Type No.
BRIGHT STAR	66-50	OLIN	0615 0614
BURGESS	G6M60 F6A60	RAY-O-VAC	AB878 AB994
DELCO	8760	RCA	VS018 VS019
EVERREADY	754 753	SEARS ROEBUCK	67E605
GENERAL	60BF65 60A6F65	USALITE	680
MONTGOMERY WARD	62A35M 62A33	WESTERN WIZARD	60B6F6/5 60A6F6/5
NATIONAL UNION	N808		

NOTE - Only one battery pack of the type listed above is required.

CAUTION - When the receiver is to operate on batteries it is necessary to insert the line cord plug in the chassis receptacle as shown in Fig. 3.

ALIGNMENT PROCEDURE

It will be necessary to remove the receiver chassis from the cabinet to make the I F. alignment adjustments. To do this, first, remove all the knobs from the control panel; next, unfasten the ANL switch and phone jack from the front panel; then, unsolder the antenna connections, two for the loop antenna and one for the whip antenna; last, remove the two screws fastened to the cabinet through the angle brackets mounted on the chassis and lift out of the case.

The primaries of the I.F. transformers are adjusted from the bottom of the chassis and the secondaries are adjusted from the top of the chassis.

Before starting the alignment procedure, check the position of the general coverage dial pointer at the low frequency end of the range. The pointer should index at the maximum capacity of the tuning capacitor.

Set the following controls before alignment.

VOLUME . . . . . Set at maximum

VOICE/CODE . . . . . Set at maximum VOICE

ANL. . . . . Set at OFF

BAND SPREAD . . . . Set at 0

ALIGNMENT CHART

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Setting	Receiver Dial Setting	Adjust	Remarks
1.	None	Stator plates in center section of tuning gang	455 kc	"1"	1000 kc	A,B,C,D	Maximum audio output at speaker voice coil. Use just enough signal generator output to obtain a 50 mw signal level.
2.	None	See step 1.	455 kc (No mod.)	"1"	1000 kc	E	With the VOICE/CODE switch set at CODE, adjust E for a 1000 cycle note.
3.	Just before r-f amplifier alignment, run band spread pointer to zero to check operation of the band spread compression trimmer. If the trimmer is fully tight before the pointer reaches zero, loosen the set screw on the drum dial and turn the drive shaft clockwise until the trimmer is fully compressed. Now back off the trimmer one and one-half turns and turn the pulley counter-clockwise until the pointer indicates 100. Now tighten the set screw on the shaft. This check permits the compression trimmer to work over its operating range without binding. Before proceeding to the next step, set the band spread dial at 0						
4.	10 mmf from ext. antenna lead to chassis.	Couple the generator to the ext. ant. lead thru a 15 mmf capacitor	30 mc	"4"	30 mc	F,G,H	Maximum output as in step 1.
5.	See step 4.	See step 4.	11.5 mc	"3"	11.5 mc	I,J,K	Maximum output as in step 1.
6.	See step 4.	See step 4.	4.4 mc	"2"	4.4 mc	L,M,N	Maximum output as in step 1.
*7.	See step 4.	See step 4.	1500 kc	"1"	1500 kc	O,P,Q	Maximum output as in step 1.

*NOTE - Loop must be reconnected for this step.

NOTES —

1. SOCKET VIEWS ARE BOTTOM VIEWS.
2. ALL VOLTAGES ARE MEASURED BETWEEN TUBE SOCKET TERMINALS & THE ELECTRICAL GROUND BUSS (NOT CHASSIS) WITH ZERO SIGNAL INPUT.
3. LINE VOLTAGE — 117 V. AC. BATTERY VOLTAGES TAKEN WITH FRESH BATTERY PACK.
4. ALL VOLTAGES SHOWN ARE DC UNLESS OTHERWISE SPECIFIED.
5. DC VOLTAGES SHOWN WERE MEASURED WITH AN ELECTRONIC VOLTMETER.
6. "NC" — NO CONNECTION.
7. "NR" — NOT READABLE (READING GENERALLY MEANINGLESS.)
8. ▭ SPACE PROVIDED FOR SERVICE METER READINGS.
9. ▱ UPPER VOLTAGE READINGS IN INDICATOR SPACE SHOW BATTERY OPERATION.
10. VOLTAGES FOR TUBE V-8, ARE SHOWN WITH VOICE-CODE SWITCH IN CODE POSITION.
11. ALL READINGS TAKEN WITH LINE PLUG POLARIZED SO THAT GROUND BUSS & CHASSIS ARE AT SAME POTENTIAL AS THE CHASSIS GROUND.

GENERAL

Tubes . . . . . .Fourteen plus voltage regulator and rectifier

Speaker Output . . . . . .500/5000 ohms

Headset Output . . . . . .High impedance

Antenna Input. . . . . .For 50 to 600 ohm line or single wire lead-in.

Phono Input . . . . . .High impedance

External Power Connector . . .Std. octal socket

Tuning Range

Band	Frequency Range	Type of Reception
1	550 kc - 1620 kc	AM/CW
2	1.62 mc - 4.9 mc	AM/CW
3	4.9 mc - 15 mc	AM/CW
4	15 mc - 32 mc	AM/CW
5	27 mc - 56 mc	AM/FM/CW
6	54 mc - 109 mc	AM/FM/CW

Intermediate Frequency . . . .455 kc/10.7 mc

Power Supply . . . . Standard Model 105-125 V. 60 Cycles AC

Universal Model 105-250 V. 25/60 cycles AC

Power Consumption . . . . . .120 Watts

POSITIONING CONTROL KNOBS

BAND SELECTOR . . .As required by flat on shaft
VOLUME . . . . . .Set at 10 for full clockwise rotation
RECEPTION . . . . .As required by markings
SELECTIVITY. . . . .As required by markings
TONE. . . . . .As required by markings
SENSITIVITY . . . . .Set at 10 for full clockwise rotation

RESTRINGING DIAL CORD

Restring the tuning condenser drive with a 45 - inch length of 30 lb. test dial cord. Tie one end of the cord to the tension spring at position "1" and follow the stringing sequence "1" "14" as shown. At position "14" stretch the tension spring and tie the cord securely to the spring. Note that the dial cord is wrapped around the tuning drive shaft two and three-quarters times for proper traction.

Restring the dial pointer drive with a 75 - inch length of 30 lb. test dial cord. Tie one end of the cord to the tension spring at position "A" and follow the stringing sequence "A" through "J" as illustrated. At position "J" stretch the tension spring and tie the cord securely.

Index the dial pointer by setting the tuning gang at maximum capacity, the RESET control in the middle of its range and aligning the pointer with the left hand dial index marker.

REPLACING LAMPS

Refer to Fig. 9, for the location of the twelve dial lamps used in the receiver. To gain access to defective lamps, reach in through the cabinet cover, remove the light shield (4 sheet metal screws), and unclip the dial lamp socket by compressing the side springs. The socket may then be brought out into the open to change the defective lamp. Replace defective lamps with 6-8 V. Mazda #44 (Blue bead) lamps, or equivalent.

ALIGNMENT PROCEDURE

IF AMP. ALIGNMENT (455 kc) - Set the controls as follows:
BAND SELECTOR . . . . . .550/1620 kc range
RECEIVE/STANDBY switch . . . .RECEIVE
CALIB. XTAL switch . . . . . .OFF
NOISE LIMITER switch . . . . . .OFF
VOLUME control. . . . . .Near maximum
RECEPTION control . . . . . .AM
SELECTIVITY control . . . . . .NORMAL/SHARP
SENSITIVITY control . . . . . .Near maximum
Set tuning dial pointer at approximately 1,000 kc.

© John F. Rider

MODELS SX-62

Connect high side of signal generator through an 0.1 mfd. capacitor to pin #1, of the 7F8 converter tube. With signal generator set at approximately 455 kc align slugs S-1,3,5,10,12 and 14 for maximum output.

Set RECEPTION control at CW and adjust slug S-8 for a 1,000 cycle note.

Set the SELECTIVITY control at CRYSTAL/BROAD. While slowly turning slug S-10 in one direction across the resonant setting obtained above, "rock" the signal generator tuning and observe the dip in the output meter reading as the adjustment passes through the response of the crystal filter. The correct setting of the slug S-10 is in the center of the observed dip. Set the signal generator at the weaker of the two responses obtained on either side of zero beat and adjust the crystal phasing trimmer C-57 for the null.

Set the SELECTIVITY control at CRYSTAL/SHARP and with trimmer C-61 set near minimum capacity, slowly increase its capacity while "rocking" the signal generator and adjust for maximum output. It may be necessary at this point to reduce the signal generator input and the receiver sensitivity to prevent overloading. After peaking the adjustment, turn the trimmer in until a drop in output of about 2 db. occurs. At this point the sharp crystal will have very good selectivity without sacrificing too much gain.

Tune the signal generator to exact crystal frequency and note output meter reading. Set the SELECTIVITY control at CRYSTAL/BROAD and note the drop in output, and output meter reading. Now switch to CRYSTAL/MEDIUM and with trimmer C-60 near minimum capacity, slowly increase its capacity, while "rocking" the signal generator, until the output meter indicates about midway between the output readings obtained in sharp crystal and broad crystal positions.

Set the SELECTIVITY control at CRYSTAL/SHARP and reset signal generator for the exact crystal frequency. Switch to NORMAL/SHARP and reset slugs S-1,3,5,12,14 and trimmer C-58 for maximum output.

Set the RECEPTION control at CW and adjust the BFO slug S-8 for zero beat.

IF AMP. ALIGNMENT (10.7 mc) - Set the mc controls as follows:

BAND SELECTOR - - - - - - 27/56 mc range
RECEIVE/STANDBY switch - RECEIVE
CALIB. XTAL switch - - - - OFF
NOISE LIMITER switch - - - OFF
VOLUME - - - - - - - - - - Near maximum
RECEPTION control - - - - - AM
SELECTIVITY control - - - - NORMAL/SHARP
SENSITIVITY control - - - - Near Maximum
Set tuning dial pointer at approx. midscale.

Connect the high side of the signal generator through an 0.1 mfd. capacitor to pin #1 of the 7F8 converter tube. Set signal generator at 10.7 mc and adjust slugs S-4, 6, 9, 13 and 15 for maximum output. Now set slugs S-2 and S-11 for maximum output, but do not readjust slugs S-4,6,9,13 and 15.

Set RECEPTION control at CW and adjust slug S-17 for zero beat.

Set RECEPTION control at FM and adjust slug S-16 for maximum output. Now set Slug S-7 for the null or minimum output as indicated on the output meter. Check the discriminator by slowly tuning the signal generator through 10.7 mc and observe the two maximum audio level readings on the output meter. If the two peaks are equal the job is done; if not, it may be necessary to reset Slug S-16 until a reasonable balance is obtained.

RF AMP ALIGNMENT

After completing the alignment of the IF amplifier stages, the RF amplifier stages may be aligned according to the following alignment chart. Connect the high side of the signal generator to terminal A-1 through the dummy antenna specified and connect a jumper between antenna terminal A-2 and GND. Use just enough signal generator output to obtain a 500 milliwatt audio output level for best results.

ALIGNMENT CHART

Dummy Antenna	Signal Generator Frequency	Band Selector Range	Radio Dial Setting	Adjust	Remarks
RMA	1500 kc	550-1600 kc	1500 kc	C-47*, 6, 21, 35	Adjust for max. output
	600 kc		600 kc	S-36*	
RMA	4.5 mc	1.62-4.9 mc	4.5 mc	C-45*, 20, 34	Adjust for max. output
	2.0 mc		2.0 mc	S-35*	
RMA	14.0 mc	4.9-15 mc	14.0 mc	C-43*, 4, 19, 33	Adjust for max. output
	7.0 mc		7.0 mc	S-34*, 22, 26, 30	
RMA	28 mc	15-32 mc	28 mc	C-42*, 3, 18, 32	Adjust for max. output
	18 mc		18 mc	S-33*, 21, 25, 29	
300-ohm non-inductive resistor	50 mc	27-56 mc	50 mc	C-41*, 2, 17, 31	Adjust for max. output
	30 mc		30 mc	S-32*, 20, 24, 28	
300-ohm non-inductive resistor	105 mc	54-109 mc	105 mc	C-40*, 1, 16, 30	Adjust for max. output
	60 mc		60 mc	S-31*, 19, 23, 27	

* Note - Calibration adjustment

Note - The standard RMA dummy antenna mention in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

MODEL FM-1,
FM Tuner

This Heathkit Frequency Modulation Tuner operates on the super regenerative principle and covers the new FM Band 88-108 Megacycles. It is 110V 60 cy power transformer operated. The tuning coils are ready assembled to the tuning condenser and the IF transformer is assembled and aligned--the tuning condenser is also aligned and set for peak performance and the trimmers are soldered to prevent misalignment during assembly. The tuner incorporates the latest type vernier slide rule dial. The dial cable is special long wearing nylon for years of service. As this unit is power transformer operated, it can safely be attached to AC-DC type receivers for amplification without danger.

The newer types of insulated resistors have a higher wattage rating. The 1/4 watt size is now rated at 1/2 watt and these are used in this kit.

Resistors and potentiometers have a tolerance rating of plus or minus 20% unless otherwise stated. Therefore, a one megohm unit may test between 800,000 and 1,200,000 ohms. The Heathkit circuits are designed to accommodate these variations.

In connecting the tuner to an amplifier, be certain that the grounded side of the tuner is connected to the grounded side of the amplifier. The usual connecting cable is a single shielded wire and the grounded side is the shield. The tuner may be connected to the phonograph or FM connection of any radio. The connecting plug depends on the type of radio and should be obtained from the radio dealer. For local stations, a single wire approximately 3 feet long can be connected to one of the antenna terminals but for distant reception an FM dipole antenna is recommended with connections. On single wire, try each post and use one with best results.

The table below lists the voltages measured between the chassis and tube socket contact. Measurements were taken with 1,000 ohms per volt voltmeter--normal variation of plus or minus 15% are to be expected due to line voltage variations.

	12A6		14F8
Pin 1	0	Pin 1	0
2	9-12VAC	2	0
3	110-150VAC	3	110-140V
4	110-150VAC	4	0
5	110-150VAC	5	40-50V
6	(used as tie point)	6	110-140V
7	0	7	9-12VAC
8	120-150V	8	3-20V

ALIGNMENT PROCEDURE

NOTES

1—Before beginning alignment, the pointer must be set at the highest mark on the dial with the tuning condenser fully open.

2—The AM section should be completely aligned before beginning the FM alignment.

3—The set should be allowed to warm up 15 minutes before aligning.

4—An output meter should be connected across the speaker voice coil for AM alignment. Keep the volume control at maximum on AM and use as low a signal input as possible for AM and FM.

5—For AM and FM tracking, bend plates of the variable (RF Section) as required.

6—In FM alignment, care must be taken to set the receiver oscillator frequency 10.7 MC *above* the incoming signal frequency.

7—The dummy antenna for FM alignment is two 150 ohm composition resistors; one in series with each generator lead.

ALIGNMENT CHART

STEP NO.	BAND SWITCH POSITION	SIGNAL GENERATOR	CONNECTION TO RECEIVER	DUMMY ANTENNA	DIAL SETTING	ADJUST	REMARKS

9	FM	98 MC CW	FM Ant. Terminals	300 ohms	98 MC	See Note 5	Adjust for Max. with VTVM from Point A to chassis.
10	FM	88 MC CW	FM Ant. Terminals	300 ohms	88 MC	See Note 5	Adjust for Max. with VTVM from Point A to chassis.

RATIO DETECTOR ALIGNMENT

(T1 and T3 should be tuned before tuning T5.)

TUNING T5 PRIMARY

Locate the ratio detector test points A, B, and C on the schematic diagram. Solder two 100,000 ohm composition resistors in series from point "A" to chassis. Connect a VTVM from point "A" to chassis and feed 10.7 MC CW into the FM antenna terminals. Adjust T5 primary (bottom slug) for maximum reading, setting the generator output to give about one volt meter reading. (An insulated aligning tool should be used for this adjustment.)

TUNING T5 SECONDARY

Connect the VTVM probe to point "C" and the VTVM common or ground lead to the junction of the two 100,000 ohm resistors. Tune T5 secondary until the meter reading reverses polarity. Set the slug at this zero point.

CHECKING BAND WIDTH

Connect the signal generator to the grid of the 2nd FM IF tube. Set the generator to 100,000 microvolts at 10.7 MC CW. Shift the generator frequency above and below 10.7 MC and record the frequencies at which the maximum positive and negative meter readings are obtained. The difference between these two readings is the bandwidth of the ratio detector and should be 250 to 300 KC.

Remove the two 100,000 ohm resistors before beginning the FM RF alignment.

INSTALLATION

YOUR RADIO IS DESIGNED FOR 110 TO 120 V. ONLY.

Installing The Outside Antenna.

The built in loop antenna on your Radio is highly efficient for the reception of local or nearby stations on the broadcast band. Short-wave reception will require some sort of an antenna connected to the set -- 5 to 15 ft. of wire stretched on the floor and connected to one of the antenna clips.

However, in locations where reception with the built in loop antenna is not satisfactory, a good outside antenna should be installed. The total length of the outside antenna, including the lead-in, should be from 50 to 80 ft. for good operation, and it should be as high as possible. Keep the antenna away from metallic objects such as other wires, guttering, grounded fire escapes, etc.

When the antenna is connected to a receiver, the antenna trimmer on the back of the chassis base must be readjusted. To do this, connect the antenna to one of the antenna terminals in the rear of the set; tune in a weak station near 600 kc. (60 on the dial); and adjust the trimmer screw with a screw driver until the signal is loudest. Antennas shorter than about 30 ft. should be connected to the SHORT Ant. clip; those much longer than this will need to be connected to the LONG Ant clip. If in doubt which to use, try both adjusting the trimmer for each, and use the connection which gives the best performance.

A good ground connection should always be provided when an outside antenna is used, and sometimes it is useful in reducing noise even when no antenna is connected to the set. Connect a wire from the GND clip in the rear of the receiver to a convenient water pipe, radiator, or conduit. If none of these are available, a wire may be run to a metal stake or pipe driven into the ground to a distance of 4 to 6 ft.

PREPARing Record Changer For Operation.

The record changer has been mounted tightly to the cabinet shelf (or drawer bottom in the Console Model) to prevent damage in shipping. A string tied around the needle arm post holds the drawer closed in the Console Model. Cut this string BEFORE trying to open the drawer. Before attempting to use the phonograph, loosen the three mounting bolt nuts on the UNDER SIDE of the shelf or drawer until the record changer is floating on its shock absorbers. (These mounting bolts are located on top of the rectangular base.) Now, remove the two rubber bands that hold the pickup arm secure and remove the cardboard holder. Remove the cardboard disc from the turntable. Finally, remove the needle guard from the pick-up arm by grasping the guard with your thrum and forefinger at the rounded ends and pulling firmly but gently downward.

Operation.

Broadcast Band (535 - 1620 Kilocycles); The broadcast band is calibrated in channel numbers. Add a zero to the dial number to get the kilocycle number.

Short-Wave Band (9 to 15.6 Megacycles) ; The short-wave band is calibrated in megacycles.

MODELS 6A47WT,
6A47WTR, 6AWC2, 6AWC3

Tone Control and Phono-Radio Switch:

Turning the knob all the way to the right throws a switch which cuts out radio reception and connects the phono-jack on the rear of the chassis base. Phonograph records may then be played through Model 6A47WT by connecting any record player to this jack. To restore radio reception, turn the tone knob all the way to the left to throw the switch back to the radio portion.

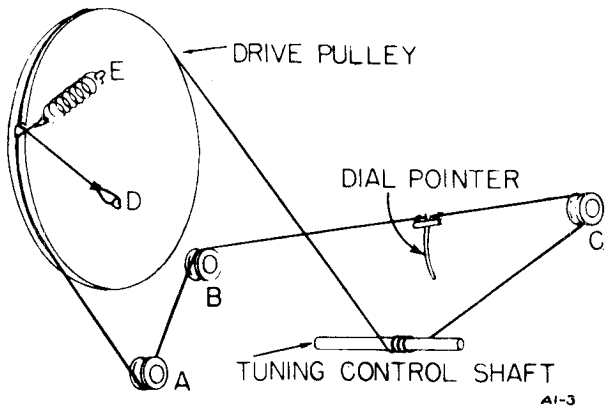
Band Switch:

This knob has two positions. The position to the right (SW) switches the tuning to the short-wave band. The position to the left (BC) provides reception on the regular broadcast band.

SERVICE DATA

Stringing the Dial Drum.

1. Turn the gang condenser to FULL CLOSED position.
2. Attach the looped end of the line cord assembly (Part #WCA103) to lug "D" as shown in the diagram.
3. String the cord through the opening on the rim of the pulley, down behind the dial and under the tuning shaft.
4. Take four turns around the shaft in a clockwise direction as viewed from the front of the chassis, progressing outward from the chassis. (Check to be sure that none of the turns lie on top of one another to avoid sloppy tuning).
5. Continue stringing the cord from the tuning shaft up to and around the small pulley "C" at the upper left hand corner of the dial bracket (as viewed from the front of the chassis). In going from the shaft to pulley "C", be sure to lead the cord between the bracket mounting leg and the tone control shaft.
6. Now, string the cord along the upper edge of the dial bracket to pulley "B" at the upper right hand corner of the bracket. (As the cord passes along the top of the dial, be sure to thread it through the opened prongs on the dial pointer.)



7. String the cord over the pulley "B" downward around pulley "A" (at the lower right hand corner of the chassis as viewed from the front), up through the opening on the rim of the dial pulley, and hook to the tension spring which has been hooked over lug "E" on the pulley.

©John F. Rider

The stringing is now completed. To fasten the pointer to the cord:

1. With the gang condenser still in CLOSED POSITION, slide the pointer to the last dot at the left hand end of the BC band (as viewed from the front of the chassis).
2. Pull the cord out from the prongs in the pointer and wrap a small piece of 1/4" tape around it at the point where the pointer pronts come.
3. Re-insert, and bend the two end prongs backward over the tape and middle prong forward. This fastens the pointer securely to the cord in the correct position, completing the stringing of the dial.

STRINGING THE TUNER

In order to string the tuner, remove tuner assembly from the chassis and remove the dial drum from the condenser shaft with a soldering iron. In doing this, it is important to note the position of the dial drum relative to the condenser plates, in order to reassemble properly.

Part #WCA102 --cord and core assembly is used for stringing the tuner. Proceed as follows:

1. Remove the S.W. coil from the fuse clip brackets.
2. Insert the S.W. coil as shown in the diagram, attaching the tuner spring to loop "E" and allowing the spring to lie loose until it is to be stretched around the pulleys and connected to the right hand hook of the B.C. core.
3. Replace the S.W. coil in the fuse clips in the approximate position shown in the diagram.
4. Rotate the gang condenser to FULL OPEN position (counter-clockwise looking from above as in the diagram).
5. Pull the core by means of the cord fastened to the left hand hook, until the left end of the core is exactly 1/4" from the first tooth on the larger radius of the cam (tooth "A" with cam rotated 180° from position shown on the diagram).
6. Proceed with the stringing as shown in the diagram, making sure that the cord is not unduly stretched or left loose between any of the teeth on the cam.

When the stringing has been completed around the cam:

7. Lay the B.C. core, which has been attached to the other end of the cord, on the bracket and remove the BC coil from the clips that hold it.
8. Insert the B.C. core in the coil form and push it through (with a small wire) until the bare hook comes into view at the other end.
9. Replace the B.C. coil in the approximate position shown on the diagram.
10. Recheck the gang--it should be in FULL OPEN position.
11. Grasp the tuner shaft firmly to prevent it from rotating. String the cordloop with the spring attached, from the right end of the S.W. core around pulley "B" only. Hook the spring to the right hand hook on the B.C. core. (The spring should be barely accessible at the right end of the B.C. coul.)
12. Release the gang condenser (being sure it is still in FULL OPEN position), and stretch the spring around the second pulley "C". Be careful not to damage the spring during this operation.
13. Adjust the B.C. coil to its correct position by sliding the coil to a point 1 1/4" from the right-hand end of the B.C. core to the beginning of the coil winding. The tuner is now strung and ready for adjustment of the S.W. coil position.

© John F. Rider

MODELS 6A47WT,
6A47WTR, 6AWC2, 6AWC3

Turn the gang condenser to its FULL CLOSED position. Insert a piece of wire which has been marked 5/8" from one end into the coil form until it hits the S.W. core. The distance from the left end of the coil form to the left end of the core should be 5/8". If this measure is not within 1/32", there has been some error made during the stringing procedure or the parts are defective. Carefully review the steps taken. If no apparent error is in evidence and the measure does not fall within this tolerance, get in touch with your Lytle & Canon firm who will furnish you a complete tuner sub-assembly already strung.

If the final measure was within the tolerance, the tuner is properly strung and ready to be replaced on the chassis base. Solder the dial drum back on, making sure that you replace it in the same position with respect to the gang plates as it originally was.

WARNING: When removing the B.C. and S.W. coils from the fuse clips, be careful not to break the fine wires or loosen any soldered connections.

NOTE: The S.W. core is distinguished from the B.C. core in that the S.W. core has a somewhat lighter color and a more satiny surface.

To remove the tubes in the 6A47WTR model it is necessary to remove the record changer first. To do this, remove the three mounting screws in the base of the changer. Disconnect all "plug-ins" as described. Lift the record changer out of the cabinet. Next, remove the three screws holding the metal cover in front of the changer and remove this cover. The tubes should now be easily accessible without removing the set from the cabinet. If not, proceed as described in the preceeding paragraph and remove the chassis from the cabinet.

ALIGNMENT PROCEDURE

I.F. Alignment

Whenever one or both I.F. transformers (T3 and T4) are changed, or the wiring associated with these transformers or with the 6SA7 or 6SF7 tubes is disturbed, it is imperative to realign the I.F. transformers. Proceed as follows:

1. Connect an output meter, a.c. voltmeter, or other suitable instrument across either primary or secondary of the output transformer, T5.
2. Turn the volume control to its maximum (clockwise); and turn the bandswitch to BC (counterclockwise).
3. Connect a signal generator from the input grid (pin 8) of the 6SA7 tube to ground, and feed in a modulated signal at 455 kc., using as small an input signal as possible yet maintaining a convenient deflection on the output meter.
4. Adjust each of the 4 screws on top the I.F. transformers for maximum output, at the same time decreasing the input from the signal generator to be sure to get a true maximum reading.
5. When this is completed, the I.F. transformers are in alignment.

R.F. Alignment:

When service operations of any sort have been performed on the antenna coil, interstage coils (T1, T2), loop antenna, gang condenser-oscillator assembly, 6SG7 tube, or circuits associated with any of these, it is important to realign the R.F. circuits for best performance.

©John F. Rider

Shortened Alignment Procedure

If the service operations have not involved the gang condenser-oscillator assembly or its associated capacitors (C18, C19, C13, C14, a shortened procedure may be used, as follows:

1. Connect the output meter and check the I.F. alignment.
2. Using broadcast stations as a guide, check the calibration of the broadcast and short-wave bands. (If no stations are available, use a signal generator--it is less likely to be accurate however, WWV time signals on 10 mc. and 15 mc. can sometimes be used to check the short-wave band calibrations). If the calibration is not reasonably close, the complete alignment procedure will be necessary. If satisfactory, proceed to connect the signal generator or multivibrator from GND terminal to the LONG ANT terminal on the loop frame.
3. Turn the band switch to BC, and set the dial to about 600 kc.
4. If a multivibrator is used, adjust the loop trimmer C6 for maximum output. If a signal generator is used, tune in the signal at about 600 kc. and adjust C6 for maximum output.
5. Turn to 1500 kc. and tune in a signal.
6. Adjust trimmers C7 and C4 for maximum output.
7. Go back to 600 kc. and disconnect the signal generator or multivibrator from the LONG ANT terminal, but leave the wire from the signal source in the vicinity of the antenna terminals. Turn up the signal source output so that the signal can be heard and readjust C6 for maximum output.
8. Reconnect the lead from the signal source to the SHORT ANT terminal through a 600 ohm resistor.
9. Turn the band switch to SW and the dial to 15 mc. Tune in a signal from the signal source at this point. (Be sure you have the correct signal and not an image.)
10. Adjust trimmers C2 and C3 for maximum output, "rocking" the tuning control as you do so.

The receiver is now in alignment for reception with the loop antenna. If an external antenna is used, the loop trimmer C6 must be realigned with the actual antenna connected as described in the installation instructions.

Complete R.F. Alignment Procedure

It is strongly recommended that the receiver be returned to the factory for any repairs involving replacement or any adjustment of the gang condenser-osicllator assembly (tuner assembly) other than adjustment of trimmers C4 and C7. If, however, it has been necessary to replace the gang condenser-oscillator assembly or capacitors C18, C19, C13, or C14 in the field, the alignment procedure is as follows:

1. Set the dial pointer so that it lines up exactly with the left hand and mark when the gang is fully closed.
2. Connect the output meter, Turn the volume control to its maximum and the bandswitch to BC. Feed in the signal generator on the grid of the 6SA7 (pin 8 to ground).
3. Check the I.F. alignment. Set the signal generator to 1000 kc. and check the generator calibration against a broadcast signal in place of the generator . Adjust C19 so that the receiver is on calibration at this point.
4. Throw the bandswitch to SW. Set the signal generator to 12 mc. and adjust C18 so that the correct signal (the one which comes in at the higher frequency <u>on the receiver dial</u>) is right on the 12 mc. mark.
5. From here on, follow the shortened procedure until the alignment of the receiver is complete.

6A47WTR, 6AWC2, 6AWC3

SUPPLEMENT

F M Operation

FM Band--88 to 180 Megacycles:

Turn the radio on by turning the volume control knob to the right. Turn the Frequency Modulation tuner on by turning the "FM On-Off" switch to the right. Wait a few seconds for the tubes to heat. Turn the tone control knob clockwise until a click is heard. The receiver will now be set for FM reception.

FM Tuning Knob:

Turn the FM tuning knob until the station is heard. Rotate the knob slowly back and forth across the station desired. The station may be heard in three positions -- the correct position is the center one in which the signal is the clearest and strongest. If the signal is too strong, reduce it by means of the VOLUME CONTROL.

Antenna:

For reception of distant stations, and improved results in locations unfavorable to FM reception, install an outside FM dipole antenna, equipped with a 300 ohm flat lead-in. Disconnect the built in antenna, by removing the wires from terminals #1 and #3 on the tuner chassis. Connect the lead-in wires of the outside antenna to the same terminals.

FM Tuner:

If your radio does not have an FM band, an FM tuner may be installed.

MODEL 130, Playfellow, Ch. CR-215

SPECIFICATIONS

Power supply	117 volts 60 cycles AC
Power consumption	58 watts
Power output	1.9 watts
Intermediate frequency	455 kc.
Tuning frequency range	540-1620 kc.
Tubes:	
Converter	12SA7
I-F Amplifier	12SK7
Detector, AVC and First Audio	12SQ7
Power output	50L6GT
Rectifier	35Z5GT
PM Speaker:	
Voice coil impedance (400 cycles)	3.0 ohms
Output transformer	2,000/3 ohms

ALIGNMENT PROCEDURE

The alignment of this receiver requires the use of an accurately calibrated r-f signal generator and an output meter. All trimmer condenser locations are shown on the chassis layout diagram. The radio volume control should be turned to maximum and the signal generator output kept as low as possible during alignment to prevent the AVC from operating and giving false readings. All alignment adjustments can be made with the loop antenna leads connected.

I-F ALIGNMENT

1. Connect the output of the signal generator to the control grid (pin No. 8) of the 12SA7 tube through a .00025 mfd. capacitor. The ground on the signal generator should be connected to the radio chassis.

2. Turn the condenser gang until it is completely meshed (low-frequency end of dial calibration) and set the input selector switch to RADIO.

3. Adjust the signal generator to EXACTLY 455 kc. and peak the second i-f transformer and the first i-f transformer in that order.

BROADCAST BAND ALIGNMENT

1. Check the tuning dial pointer adjustment. When the plates of the tuning condenser are completely meshed the dial pointer must be in line with the last calibration mark at the low frequency end of the dial. If it is not, remove escutcheon plate and move.

2. Form three turns of wire into a loop, connect this loop to the signal generator, and loosely couple it to the receiver loop antenna in the cabinet lid.

3. Set the signal generator and the radio receiver to 1400 kc. and adjust the 1400 kc. oscillator trimmer.

4. Set the signal generator and dial to 600 kc. While rocking the gang back and forth around 600 kc. adjust the oscillator coil slug for maximum output.

5. Check the 1400 calibration and correct if necessary with the oscillator trimmer.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

STAGE GAINS*

R-F on Converter to I-F Grid at:	
600 kc.	47
I-F on Converter Grid to I-F Grid at:	
455 kc. (gang closed)	59
I-F Grid to Detector Plate at:	
455 kc.	50

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor at:

600 kc. ..... 7.0 V.

or 0.32 ma. through 22,000 ohm Oscillator Grid Resistor.

AUDIO GAIN

Voltage required across the Volume Control to produce 0.5 watt speaker output** at 400 cycles is .19 volt with Input Selector Switch in RAD setting.

*Variations of ± 20% are permissible. All readings made with sufficient input signal to provide 0.5 watt speaker output.

**0.5 watt speaker output at 400 cycles is equivalent to a reading of 1.22 volts as measured by a high resistance AC voltmeter across the voice coil of speaker.

ALIGNMENT PROCEDURE

Alignment of this receiver requires the use of an accurately calibrated RF signal generator, range 455 kc. to 107 mc., an output meter, and a vacuum tube voltmeter of greater than 10 megohm input impedance. All trimmer condensers can be identified by stampings on the chassis and gang condenser cover and are shown on the chassis layout diagram.

The pointer on the radio dial should line up with the first vertical mark on the low frequency end of the dial glass. If the pointer does not line up, loosen the pointer on the dial string and move it to correct position. Re-tighten and re-cement the pointer to the string. Be sure the gang is fully meshed for this pointer alignment. Align AM first.

AM ALIGNMENT

I-F ALIGNMENT

1. Set volume, treble, and bass controls to maximum. Set Band Switch to Broadcast position, and dial pointer to 1000 kc.
2. Tune the signal generator to EXACTLY 455 kc.
3. Connect output of modulated signal generator to the signal grid of the 6BE6 (pin 7) through a .01 mfd. capacitor and signal generator ground to radio chassis.
4. AM and FM i-f transformers on this model are separate and can be identified on the chassis layout diagram Figure 3.
5. Connect output meter across voice coil of speaker and adjust the i-f transformers for peak output as indicated on the output meter.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Connect 455 kc. sweep generator having approximately 20 kc. sweep to signal grid of 6BE6 (pin 7) through a .01 mfd. capacitor. Connect an oscilloscope through a 1 megohm isolating resistor across the 150,000 ohm diode load resistor. Align for best possible peak and symmetry.

R-F ALIGNMENT

1. Remove the signal generator lead from the 6BE6 grid and connect it across H and L on terminal strip on the rear of the chassis. The high side of the signal generator should be connected to H and the signal generator ground to L.
2. Check the tuning dial pointer adjustment. When the plates of the tuning condenser are completely meshed, the dial pointer must be in line with the last calibration mark at the low frequency end of the dial. If it is not, slide the pointer on its string to the correct position. Be sure to crimp the lugs (on the rear of the pointer) tightly around the string to hold the pointer in adjustment.
3. Set the signal generator and the radio receiver to 1400 kc., adjust the 1400 kc. oscillator trimmer and the 1400 kc. r-f trimmer for maximum output.
4. Set the signal generator and radio receiver to 600 kc. Adjust the oscillator and r-f coil slugs for maximum output. If considerable adjustment was necessary re-check the 1400 kc. trimmer settings.
5. Replace chassis in cabinet and connect loop antenna leads to proper terminals on the rear of the chassis.
6. Form three turns of wire into a loop, connect this loop to the signal generator and loosely couple it to the receiver loop antenna.
7. With the signal generator and dial at 1400 kc., adjust the loop antenna trimmer for maximum output.

MODEL CR-216

FM ALIGNMENT

DISCRIMINATOR ALIGNMENT

1. Tune signal generator to EXACTLY 10.775 mc. and connect to pin 4 of the 6SH7 Limiter tube socket through a .01 mfd. capacitor.

2. Connect a DC vacuum tube voltmeter between point "B" on schematic diagram and ground (across .00047 mfd. capacitor—Pin 6 on 6H6 to ground).

3. Peak both discriminator slugs at 10.775 mc.

4. Retune signal generator to exactly 10.7 mc. and adjust bottom slug for zero volts.

5. The DC voltage at 10.625 mc. should be within 10% of the voltage at 10.775 mc. and of opposite polarity.

Note: If the signal generator is not capable of sufficient output to produce a readable DC voltage, the amplification of the last i-f stage can be used to increase the signal input to the limiter for discriminator alignment. To accomplish this, align the last i-f stage as indicated in "IF Alignment". Then align discriminator as above leaving the signal generator connected to the grid of the 6SG7 2nd i-f tube.

I-F ALIGNMENT

1. Connect high side of signal generator, through a .01 mfd. capacitor and a 1000 ohm resistor in series, to pin 4 of the 6SG7 2nd i-f tube. Connect low side of generator to chassis.

2. Close gang condenser and connect vacuum tube voltmeter across 220,000 ohm limiter grid resistor; (Point "A" on schematic to ground). Adjust signal generator output until a reading of at least 3 volts is obtained. In order to reduce regeneration caused by the vacuum tube voltmeter leads, a 1-megohm isolating resistor, connected with as short leads as possible to point "A" should be used in series with the vacuum tube voltmeter. Align the 3rd i-f transformer for best peak as indicated on voltmeter.

3. Repeat above for each succeeding transformer by connecting signal generator to signal grid of first i-f tube 6SG7 then to the signal grid of 6BE6 converter. The i-f stages should be aligned in this order.

WARNING—After each i-f stage has been aligned, do not repeak with the signal into the grid of the 6BE6.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Replace signal generator with sweep generator having approximately 300 kc. sweep and tune generator to 10.7 mc. Connect oscilloscope across 220,000 ohm limiter grid resistor through a 1-megohm isolating resistor. The order of alignment is the same as when using a vacuum tube voltmeter. Each i-f transformer should be individually aligned for best peak and symmetry.

R-F ALIGNMENT

1. Connect vacuum tube voltmeter across limiter grid resistor as in FM I-F alignment.

2. Ground one side of the FM Antenna by placing a wire jumper from one FM connection on the antenna terminal strip to the ground connection.

3. Connect unmodulated signal generator through a 300 ohm resistor to ungrounded antenna post and chassis, and tune signal generator to 107 mc.

4. Set radio dial to 107 mc. and tune oscillator trimmer to peak output on vacuum tube voltmeter. Adjust signal generator output until a reading of at least 3 volts is obtained.

5. Tune 107 mc. r-f and antenna trimmers for maximum indication on voltmeter—it may be necessary to rock the dial while adjusting the r-f trimmer.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

STAGE GAINS*

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor (105) at:

600 kc. ..... 6.6V.
98 mc. ..... 6.0V.

or 0.3 ma. through 22,000 ohm Oscillator Grid Resistor at 600 kc. and 0.27 ma. at 98 mc.

AUDIO GAIN

Voltage required across the Volume Control to produce 0.1 watt speaker output*** at 400 cycles is .016 volt with Input Selector Switch in BDCST. setting.

*Variations of ±20% are permissible. All readings made with sufficient input signal to provide 0.5 watt speaker output. 0.5 speaker output at 400 cycles is equivalent to a reading of 1.25V. as measured by a high resistance AC voltmeter across the voice coil of the speaker.
**Detector Plate on AM.
***0.1 watt speaker output at 400 cycles is equivalent to a reading of 0.55 volts as measured by a high resistance AC voltmeter across the voice coil of speaker.

DIAL CORD REPLACEMENT

Two separate drive cables are used in the CR-216 dial assembly. One cable is used to transmit the motion from the tuning knob to the large pulley that is coupled to the condenser gang; the other cable actuates the dial pointer whenever the large pulley on the condenser gang is rotated. Separate instructions for replacing either of these cables is given in the following paragraphs.

CONDENSER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slide a short length (approximately ½ inch) of sleeving over one end of a length of dial cable, form a small loop and tie a knot in the manner shown on Figure 1. Tie spring to opposite end of cable making length excluding spring 19½ inches. Hook loop over the metal hook in pulley "D" and lace the cable through the pulley slot and around the pulley in a counterclockwise direction when viewed from the rear of the dial assembly keeping the cable to the rear of the pulley groove. Lace the cable around the smaller diameter portion of the tuning control shaft wrapping 2½ turns *from front to back;* then around the opposite side of pulley "D" into the pulley through the slot. Hook the end of tension spring "F" in the hole provided in pulley "D", completing this operation.

DIAL POINTER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slip a one-half inch length of sleeving over a 42-inch length of dial cable. Tie the two ends to the loop end of the cable spring "E" securely so that the cable doubled measures 19⅝ inches end to end excluding spring.

Place spring hook in top hole and draw cable through slot of pulley "D". Loop one end of cable around pulley "D" in a clockwise direction in front of condenser drive cable (viewing dial assembly from front) then loop the remaining end around pulley in a counterclockwise direction. Secure both ends of cable to chassis at edge of pulley slot with scotch tape, keeping piece of sleeving on remaining loop of cable.

Replace dial assembly and loop cable over pulley "A". While holding cable taut remove scotch tape and loop cable over pulleys "B" and "C" as shown in Figure 1.

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. The short piece of sleeving installed prior to the stringing operation should be slid to the rear of the dial pointer and the crimping lug on the pointer pressed over the sleeving. After checking to make certain that the condenser gang is completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to each end of the sleeving to which the dial pointer is fastened. This completes the operation.

MODEL CR-217

GENERAL

Model CR-217 radio chassis is an AM-FM tuner that must be used in conjunction with a power amplifier such as the AMP-116 for speaker operation. Heater and plate voltages for the CR-213 radio chassis are supplied from the amplifier chassis; it is therefore essential that the radio and amplifier chassis be interconnected during alignment or for other electrical service operations.

METHOD OF REMOVING CHASSIS FROM CABINET

Model CR-217 radio chassis is designed for easy removal from the cabinet in which it is installed. As the radio panel is permanently fastened to the chassis, the control knobs need not be removed when the chassis is taken out of the cabinet for service.

To remove the chassis, first remove the antenna leads from their terminals and all plugs from the receptacles on the rear of the chassis. Then remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis.

In the Embassy the chassis is removed through the front panel opening. Remove the three wood cleats (secured by wood screws) in front of the chassis panel. Lift the rear of the chassis about an inch and pull it straight back enough to disengage the two hook plates from the chassis tray and then remove the chassis through the front of the cabinet. Never remove the chassis tray from the cabinet it has been properly positioned to bring the radio panel in place when the chassis is replaced.

To replace the chassis slide it into the cabinet from the front and push it in far enough for the hook plates on the chassis to engage the slots in the chassis tray. With the chassis in this position install the three wood cleats in front of the chassis panel. Push the chassis forward until the panel is approximately 1/16" from the back of the cleats and secure in position with tho two Phillips head screws.

CAUTION: Make sure the chassis panel does not touch the wood cleats or acoustic feedback may result. Replace all plugs in their receptacles and the antenna leads on their correct terminals. The antenna terminal board for the loop antenna connections is designated L-H. The two terminals on the loop are designated L and H; the leads connected to these terminals should be wired to the corresponding terminals (L and H) on the chassis.

ALIGNMENT PROCEDURE

Alignment of this receiver requires the use of an accurately calibrated RF signal generator, range 455 kc. to 107mc., an output meter, and a vacuum tube voltmeter of approximately 10 megohm input impedance. All trimmer condensers can be identified by stampings on the chassis and gang condenser cover and are shown on the chassis layout diagram.

The pointer on the radio dial should line up with the first horizontal mark on the low frequency end of the dial glass. If the pointer does not line up, loosen the screws on the pointer drive pulley at the end of the tuning gang and adjust the pointer setting; tighten the screws after this adjustment. Be sure the gang is fully meshed for this pointer alignment.

AM ALIGNMENT

I-F ALIGNMENT

1. Set range control to position No. 1. Set volume, treble and bass controls to maximum, the Band Switch to Broadcast position, and dial pointer to 1000 kc.

2. Tune the signal generator to EXACTLY 455 kc.

3. Connect output of modulated signal generator to the signal grid of the 6SB7Y (pin 8) through a .01 mfd. capacitor and signal generator ground to radio chassis.

4. All i-f transformers on this chassis are slug-tuned. Both slug adjustments for 455 kc. are located on top of the transformers; the 10.7 mc. adjustments are accessible on the bottom.

5. Connect output meter across voice coil of 15-inch speaker and peak in order the third, second and first i-f transformers.

6. Use only enough signal input to give a readable indication on voltmeter so that the AVC will not operate and give false readings.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Connect 455 kc. sweep generator having approximately 40 kc. sweep to signal grid of 6SB7Y (pin 8) through a .01 mfd. capacitor. Connect an oscilloscope through a 1 megohm isolating resistor across the 220,000 ohm diode load resistor. Align for best possible peak with range switch in position No. 1, and symmetry in position No. 4.

© John F. Rider

BROADCAST BAND R-F ALIGNMENT

1. Connect signal generator through .00025 mfd. capacitor to antenna and ground terminals on antenna terminal strip on rear of chassis. Be sure "Ant-loop" switch on top of the chassis is in the ANT. position. Connect output meter as for AM i-f alignment.

2. Tune signal generator to 1400 kc.

3. Set dial to 1400 kc. and adjust oscillator, r-f and antenna trimmers for maximum indication on meter.

4. Set signal generator to 600 kc. and tune radio to signal. Adjust the 600 kc. padder to maximum output while simultaneously rocking the gang.

5. 1400 kc. calibration should then be checked and re-adjusted if necessary with the 1400 kc. oscillator trimmer.

SHORT WAVE BAND R-F ALIGNMENT

1. Set the Band Switch to Short Wave and replace the .00025 mfd. capacitor in series with the signal generator lead to the antenna terminal, with a 400-ohm resistor.

2. Set the signal generator and the receiver to 15 mc. and adjust the oscillator, r-f and antenna trimmers for maximum indication on the meter. While adjusting the 15 mc. oscillator trimmer, two peaks may be observed; only one is the correct peak for 15 mc alignment. To obtain the correct peak, screw trimmer in to maximum capacitance, then decrease until the first peak is observed. This is the correct one.

Another method for checking for the correct peak is to tune the receiver to 15.91 mc. with signal generator at 15 mc. and with the output increased. If the 15 mc. oscillator trimmer is properly adjusted, the signal will be received at 15.91 mc. if incorrectly aligned, the signal will be received at 14.09 mc.

FM ALIGNMENT

DISCRIMINATOR ALIGNMENT

1. Tune signal generator to EXACTLY 10.775 mc. and connect to pin 4 of the 6SH7 limiter tube socket through a .01 mfd. capacitor.

2. Connect a DC vacuum tube voltmeter from Pin 4 on 6H6 tube socket to ground through a 1 megohm isolating resistor.

3. Peak both discriminator slugs at 10.775 mc.

4. Retune signal generator to exactly 10.7 mc. and adjust bottom slug for zero volts.

5. The DC voltage at 10.625 mc. should be within 10% of the voltage at 10.775 mc. and of opposite polarity.

Note: If the signal generator is not capable of sufficient output to produce a readable DC voltage, the amplification of the last i-f stage can be used to increase the signal input to the limiter for discriminator alignment. To accomplish this, align the last i-f stage as indicated in "IF Alignment". Then align discriminator as above leaving the signal generator connected to the grid of the 6SG7 2nd i-f tube.

I-F ALIGNMENT

1. Connect high side of signal generator, through a .01 mfd. capacitor and a 1000 ohm resistor in series, to pin 4 of the 6SG7 2nd i-f tube. Connect low side of generator to chassis.

2. Close gang condenser and connect vacuum tube voltmeter across 220,000 ohm limiter grid resistor; (Points "A" to "X" on schematic). Adjust signal generator output until a reading of at least 3 volts is obtained. In order to reduce regeneration caused by the vacuum tube voltmeter leads, a 1-megohm isolating resistor, connected with as short leads as possible to point "A" should be used in series with the vacuum tube voltmeter. Align the 3rd i-f transformer for best peak as indicated on voltmeter.

3. Repeat above for the 2nd and 1st transformer by connecting signal generator to signal grid of first i-f tube 6SG7 then to the signal grid of 6SB7Y converter. The i-f stages should be aligned in this order.

WARNING—After each i-f stage has been individually aligned, do not repeak with the signal into the grid of the 6SB7Y.

© John F. Rider

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Replace signal generator with sweep generator having approximately 300 kc. sweep and tune generator to 10.7 mc. Connect oscilloscope across 220,000 ohm limiter grid resistor through a 1-megohm isolating resistor. The order of alignment is the same as when using a vacuum tube voltmeter. Each i-f transformer should be individually aligned for best peak and symmetry.

R-F ALIGNMENT

1. Connect vacuum tube voltmeter across limiter grid resistor as in FM I-F alignment. Adjust signal generator output until a reading of at least 3 volts is obtained.

2. Ground one side of the FM Antenna by placing a wire jumper from one FM connection on the antenna terminal strip to the ground connection.

3. Connect unmodulated signal generator through a 300 ohm resistor to ungrounded antenna post and chassis, and tune signal generator to 107 mc.

4. Set radio dial to 107 mc. and tune oscillator trimmer to peak output on vacuum tube voltmeter.

5. Tune 107 mc. r-f and antenna trimmers for maximum indication on voltmeter—it may be necessary to rock the gang while adjusting the r-f trimmer.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

STAGE GAINS*

Antenna Post to R-F Grid at:

600 kc.	5.8
6.5 mc.	2.9
98 mc.	1.0

R-F Grid to Converter Grid at:

600 kc.	11.6
6.5 mc.	9.5
98 mc.	6.8

R-F on Converter Grid to 455 kc. on I-F Grid at:

600 kc.	1.7
6.5 mc.	2.4
98 mc.	6.8

I-F on Converter Grid to 1st I-F Grid at:

455 kc. (dial pointer at 600 kc.)	2.6

1st I-F Grid to 2nd I-F Grid at:

455 kc.	20.5
10.7 mc.	37

2nd I-F Grid to Limiter Grid at:

10.7 mc.	34.5

AUDIO GAIN

Voltage required across the Volume Control to produce 0.1 watt speaker output** at 400 cycles is:

.013 volt with Amplifier AMP-116

with Band Switch in BDCST setting.

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor (105) at:

600 kc.	4.5V.
6.5 mc.	4.6V.
98 mc.	5.4V.

or 0.3 ma. through 15,000 ohm Oscillator Grid Resistor at 600 kc., 0.31 ma. at 6.5 mc. and 0.36 ma. at 98 mc.

*Variations of ± 20% are permissible. All AM readings made with sufficient input signal to provide 0.5 watt speaker output. 0.5 watt speaker output at 400 cycles is equivalent to a reading of 2.75V. as measured by a high resistance AC voltmeter across the voice coil of the 15-inch speaker.

**0.1 watt speaker output at 400 cycles is equivalent to a reading of 1.22 volts as measured by a high resistance AC voltmeter across the voice coil of 15-inch speaker.

10 KC. FILTER ADJUSTMENT

This chassis incorporates a 10 kc. filter circuit to eliminate the beat note heard as a whistle between stations on the broadcast band. If the trimmer is out of adjustment the following procedure should be observed:

1. Adjust the range control switch to the No. 3 setting.

2. Remove the phono pickup plug from the radio chassis and connect the output of an audio oscillator to the phonograph pickup socket. Adjust the oscillator to exactly 10,000 cycles.

3. Set the band selector to PHONO and adjust the 10 kc. trimmer for minimum output.

4. If an audio oscillator is not available for making this adjustment set the band selector to BDCST, set the range control to position 4, connect the antenna to the receiver and set the gang condenser to a point between two stations on adjacent channels having approximately the same power. If the 10 kc. trimmer is out of adjustment, a whistle will be heard. Adjust the trimmer until the whistle is eliminated.

©John F. Rider

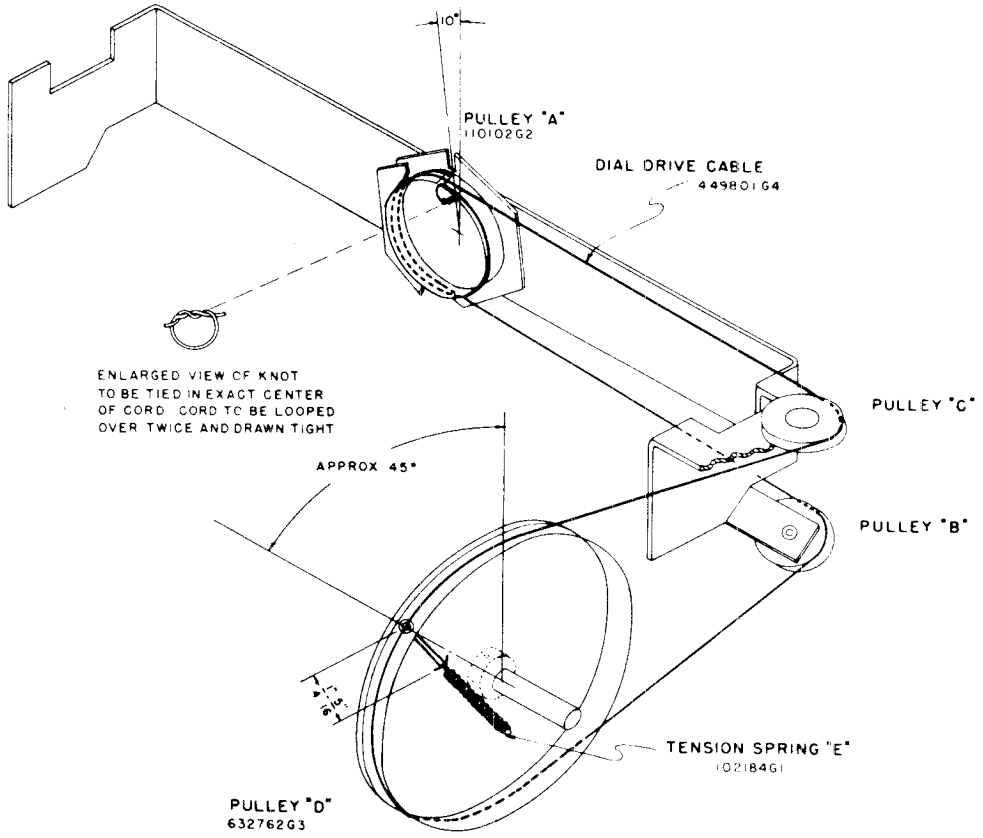

FIGURE 1

DIAL CORD REPLACEMENT

Rotate the brass pulley designated "A" in Figure 1 until the dial pointer strikes the stop at the high frequency end of the dial calibration. In this condition the slot in pulley "A" should be approximately ten degrees to the left of being vertical--see Figure 1. If the slot in the pulley is in some other position under the above mentioned conditions, the pointer set screw is probably loose and has allowed the pointer to slip.

To correct this condition, first remove the glass dial and loosen the pointer screw. Then while holding pulley "A" so that its slot is approximately ten degrees to the left of vertical (when viewed from the rear) adjust the pointer until it is resting against the stop at the high frequency end of its travel. Then tighten the pointer set screw securely and replace the glass dial.

Completely unmesh the condenser gang and check the location of the hole or slot in pulley "D". If this hole is not approximately 45 degrees back from vertical as shown on Figure 1, loosen the two No. 6 Allen set screws in the hub of pulley "D" and slip the pulley on its shaft (while holding the condenser gang unmeshed) until the specified adjustment is obtained; then tighten one of the set screws securely. It will be shown later that this is a temporary setting. Next, tie a double knot in the exact center of a 25-inch length of dial cable and fold the cable back on itself so that the knot is at one end. The correct method for tying this knot is shown as an inset on Figure 1. Grasp the cable near the knotted end and slide it into the pulley slot so that the knot is against the inside rim of the pulley as shown in the sketch. The piece of cable nearest the dial frame should be wound in the direction shown for one-half turn; then over the lower pulley "B", around the bottom of the large pulley "D" and into the hole. Pull the cable

©John F. Rider

taut and wrap the end around the small hook on pulley "D" temporarily.

The remaining piece of cable should be wound around pulley "A" in the direction shown, for one complete turn, over the upper pulley "C", and over the top of pulley "D". Thread the end through the small hole in pulley "D" and pull both ends of the cable taut. With one end of tension spring "E" fastened to the hook on pulley "D" lace the two free ends of the cable through the opposite end of the spring and tie a knot at a point that will allow 1/4" to 5/16" of cable between the spring and the inside rim of pulley "D". Be sure to tie the knot around one coil of the spring in the manner shown.

Now with the condenser gang completely meshed, check the position of the dial pointer. If it is not in line with the last calibration mark at the low frequency end of the dial, loosen the set screw in pulley "D" and turn it until the pointer is in the specified position. Be sure that the condenser gang does not move during this adjustment. Then tighten the two screws in pulley "D" securely completing the operation.

CONDENSER GANG DRIVE ADJUSTMENTS

Whenever any of the mechanical parts in the condenser gang drive assembly require replacement due to rough handling or for any other reason, it is extremely important that clearances and adjustments shown on Figures 2 and 3 are correct; otherwise, the tuning mechanism will be sluggish or it may slip during operation.

In reassembling the mechanism after any part was replaced, follow the procedure outlined below:

1. Assemble the Tuning Shaft, Drive Collar, Compression Spring and Flywheel in the order shown on Figure 3. The distance between the front of the Drive Collar and the front of the Tuning Shaft must be 1 1/8

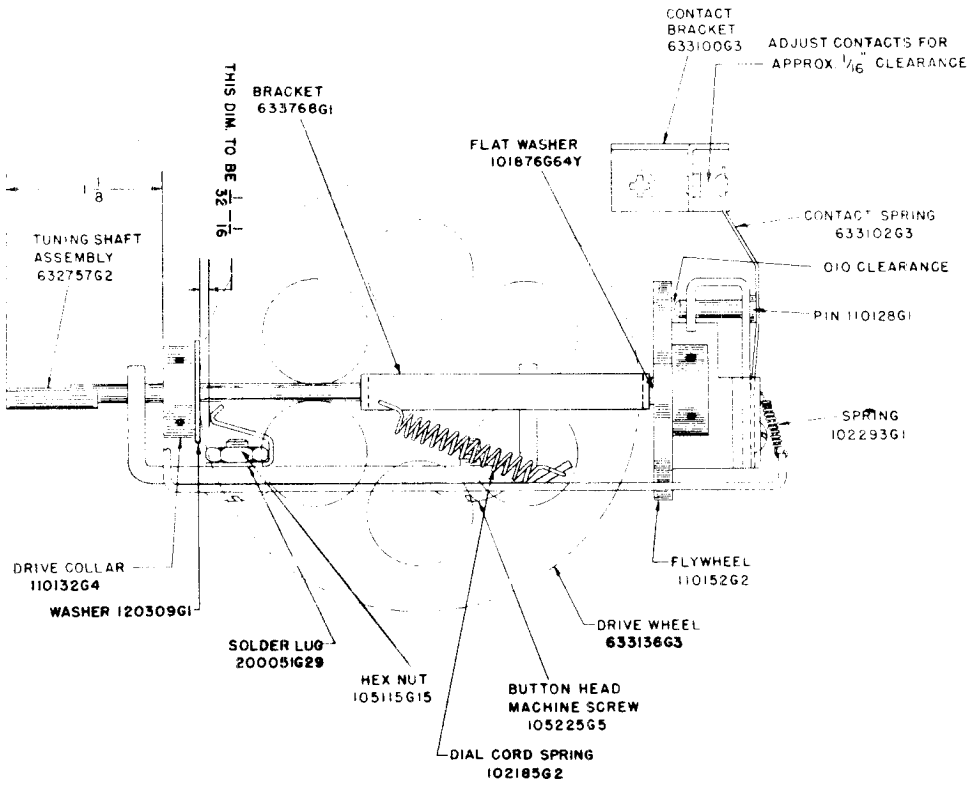

FIGURE 2

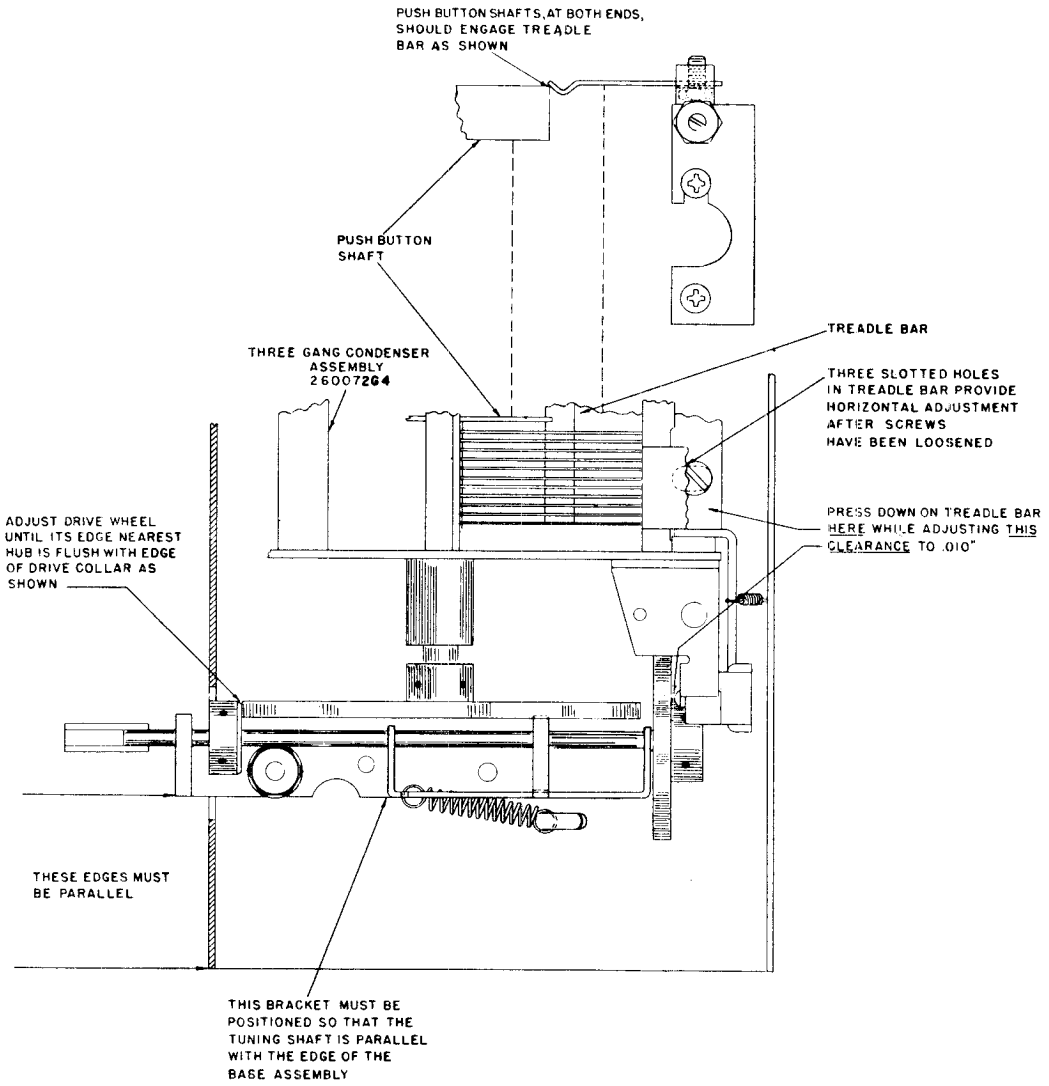
© John F. Rider

inches as specified on Figure 2. Install the Flywheel on the rear of the Tuning Shaft and slide it forward until it nearly touches the edge of the Drive Wheel; then tighten one of the set screws in the Flywheel hub. Insert a .010" gauge between the Flywheel and the Pin, and while holding the gauge in this position, loosen the set screw in the Flywheel hub that was previously tightened. The Compression Spring should force the Flywheel back against the gauge—when this occurs, tighten both set screws in the Flywheel hub.

2. Adjust the Muting Switch contact clearance by loosening the two screws in the Contact Bracket and sliding the bracket in the required direction until a 1/16" clearance is obtained. If this adjustment cannot be obtained in the manner prescribed, bend the Contact Bracket until proper clearance is realized.



PUSH BUTTON SHAFTS, AT BOTH ENDS, SHOULD ENGAGE TREADLE BAR AS SHOWN

THREE GANG CONDENSER ASSEMBLY 26007264
TREADLE BAR
THREE SLOTTED HOLES IN TREADLE BAR PROVIDE HORIZONTAL ADJUSTMENT AFTER SCREWS HAVE BEEN LOOSENED
PRESS DOWN ON TREADLE BAR HERE WHILE ADJUSTING THIS CLEARANCE TO .010"
ADJUST DRIVE WHEEL UNTIL ITS EDGE NEAREST HUB IS FLUSH WITH EDGE OF DRIVE COLLAR AS SHOWN
THESE EDGES MUST BE PARALLEL
THIS BRACKET MUST BE POSITIONED SO THAT THE TUNING SHAFT IS PARALLEL WITH THE EDGE OF THE BASE ASSEMBLY

FIGURE 3

3. The Drive Wheel is properly located on its shaft when its edge nearest the hub is in line with the outside edge of the Drive Collar as shown on Figure 3. Two Allen set screws in the Drive Wheel hub provide a means of adjusting the position of this wheel.

4. When the adjustment outlined in paragraph 2 is correct, the proper contact clearance will automatically be obtained when the Muting Switch is to be "unmuted" while the push buttons are being set. While pressure is applied to any one of the push buttons while they are being set up, a pressure applied simultaneously to the Tuning Control knob will cause the Muting Switch contacts to open. Detailed instructions on setting up these push buttons are shown elsewhere in this bulletin.

5. If the push button shafts at both ends do not engage the Treadle Bar as shown on Figure 3, the three screws in the Treadle Bar must be loosened and the Treadle Bar should be moved until the required condition is obtained.

GENERAL

It frequently becomes necessary to make minor changes in the electrical circuit of a chassis to provide the correct response for different cabinets or speaker systems.

When this becomes necessary such a variation from the original chassis is indicated by a suffix letter; example: 500B.

Whenever necessary Service Bulletin Supplements will be issued with latest schematic drawings and parts lists indicating these changes.

METHOD FOR REMOVING CHASSIS FROM CABINET

Model CR-223 radio chassis is designed for easy removal from the cabinet in which it is installed. As the radio panel is permanently fastened to the chassis, the control knobs need not be removed when the chassis is taken out of the cabinet for service.

To remove the chassis, first remove the antenna leads from their terminals and all plugs from the receptacles on the rear of the chassis. Then remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Lift the rear of the chassis about one inch and pull it straight back. Never remove the chassis tray from the cabinet—it has been properly positioned to bring the radio panel in place when the chassis is replaced. In replacing the chassis, slide it so that the small hooks near the front, ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go and the hook should then engage the slots in the chassis tray. Replace the two Phillips-head screws and nuts and tighten securely. Replace all plugs in their receptacles and the antenna leads on their correct terminals. The antenna terminal board for the loop antenna connections is designated L-H. The two terminals on the loop are designated L and H; the leads connected to these terminals should be wired to the corresponding terminals (L and H) on the chassis.

ALIGNMENT PROCEDURE

Alignment of this receiver requires the use of an accurately calibrated r-f signal generator, range 455 kc. to 107 mc., an output meter, and a vacuum tube voltmeter of greater than 10 megohm input impedance. All trimmer condensers can be identified by stampings on the chassis and gang condenser cover and are shown on the chassis layout diagram.

The pointer on the radio dial should line up with the first vertical mark on the low frequency end of the dial glass. If the pointer does not line up, loosen the pointer on the dial string and move it to correct position. Re-tighten and re-cement the pointer to the string. Be sure the gang is fully meshed for this pointer alignment. Align AM first.

AM ALIGNMENT

I-F ALIGNMENT

1. Set volume, treble, and bass controls to maximum. Set Band Switch to Broadcast position, and dial pointer to 1000 kc.
2. Tune the signal generator to EXACTLY 455 kc.
3. Connect output of modulated signal generator to the signal grid of the 6BE6 (pin 7) through a .01 mfd. capacitor and signal generator ground to radio chassis.
4. AM and FM i-f transformers on this model are separate and can be identified on the chassis layout diagram Figure 3.
5. Connect output meter across voice coil of speaker and adjust the i-f transformers for peak output as indicated on the output meter.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Connect 455 kc. sweep generator having approximately 20 kc. sweep to signal grid of 6BE6 (pin 7) through a .01 mfd. capacitor. Connect an oscilloscope through a 1 megohm isolating resistor across the 150,000 ohm diode load resistor. Align for best possible peak and symmetry.

R-F ALIGNMENT

1. Remove the signal generator lead from the 6BE6 grid and connect it across H and L on terminal strip on the rear of the chassis. The high side of the signal generator should be connected to H and the signal generator ground to L.

2. Set the signal generator and the radio receiver to 1400 kc., adjust the 1400 kc. oscillator trimmer and the 1400 kc. r-f trimmer for maximum output.

3. Set the signal generator and radio receiver to 600 kc. Adjust the oscillator and r-f coil slugs for maximum output. If considerable adjustment was necessary re-check the 1400 kc. trimmer settings.

4. Replace chassis in cabinet and connect loop antenna leads to proper terminals on the rear of the chassis.

5. Form three turns of wire into a loop, connect this loop to the signal generator and loosely couple it to the receiver loop antenna.

6. With the signal generator and dial at 1400 kc., adjust the loop antenna trimmer for maximum output.

©John F. Rider

FM ALIGNMENT

DISCRIMINATOR ALIGNMENT

1. Tune signal generator to EXACTLY 10.775 mc. and connect to pin 4 of the 6SH7 Limiter tube socket through a .01 mfd. capacitor.

2. Connect a DC vacuum tube voltmeter between point "B" on schematic diagram and ground (across .00047 mfd. capacitor—Pin 6 on 6H6 to ground).

3. Peak both discriminator slugs at 10.775 mc.

4. Retune signal generator to exactly 10.7 mc. and adjust bottom slug for zero volts.

5. The DC voltage at 10.625 mc. should be within 10% of the voltage at 10.775 mc. and of opposite polarity.

Note: If the signal generator is not capable of sufficient output to produce a readable DC voltage, the amplification of the last i-f stage can be used to increase the signal input to the limiter for discriminator alignment. To accomplish this, align the last i-f stage as indicated in "IF Alignment". Then align discriminator as above leaving the signal generator connected to the grid of the 6SG7 2nd i-f tube.

I-F ALIGNMENT

1. Connect high side of signal generator, through a .01 mfd. capacitor and a 1000 ohm resistor in series, to pin 4 of the 6SG7 2nd i-f tube. Connect low side of generator to chassis.

2. Close gang condenser and connect vacuum tube voltmeter across 220,000 ohm limiter grid resistor; (Point "A" on schematic to ground). Adjust signal generator output until a reading of at least 3 volts is obtained. In order to reduce regeneration caused by the vacuum tube voltmeter leads, a 1-megohm isolating resistor, connected with as short leads as possible to point "A" should be used in series with the vacuum tube voltmeter. Align the 3rd i-f transformer for best peak as indicated on voltmeter.

3. Repeat above for each succeeding transformer by connecting signal generator to signal grid of first i-f tube 6SG7 then to the signal grid of 6BE6 converter.

The i-f stages should be aligned in this order.

WARNING—After each i-f stage has been aligned, do not repeak with the signal into the grid of the 6BE6.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Replace signal generator with sweep generator having approximately 300 kc. sweep and tune generator to 10.7 mc. Connect oscilloscope across 220,000 ohm limiter grid resistor through a 1-megohm isolating resistor. The order of alignment is the same as when using a vacuum tube voltmeter. Each i-f transformer should be individually aligned for best peak and symmetry.

R-F ALIGNMENT

1. Connect vacuum tube voltmeter across limiter grid resistor as in FM I-F alignment.

2. Ground one side of the FM Antenna by placing a wire jumper from one FM connection on the antenna terminal strip to the ground connection.

3. Connect unmodulated signal generator through a 300 ohm resistor to ungrounded antenna post and chassis, and tune signal generator to 107 mc.

4. Set radio dial to 107 mc. and tune oscillator trimmer to peak output on vacuum tube voltmeter. Adjust signal generator output until a reading of at least 3 volts is obtained.

5. Tune 107 mc. r-f and antenna trimmers for maximum indication on voltmeter—it may be necessary to rock the dial while adjusting the r-f trimmer.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

STAGE GAINS*

Antenna Post to R-F Grid at:
- 600 kc. 5.00
- 98 mc. 1.15

R-F Grid to Converter Grid at:
- 600 kc. 14.5
- 98 mc. 9.4

R-F on Converter Grid to 455 kc. on I-F Grid at:
- 600 kc. 25.0
- 98 mc. 3.2

I-F on Converter Grid to 1st I-F Grid at:
- 455 kc. (gang closed) 28.0

1st I-F Grid to 2nd I-F Grid** at:
- 455 kc. 95
- 10.7 mc. 33

2nd I-F Grid to Limiter Grid at:
- 10.7 mc. 33.4

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor (105) at:
- 600 kc. 6.6V
- 98 mc. 6.0V

or 0.3 ma. through 22,000 ohm Oscillator Grid Resistor at 600 kc. and 0.27 ma. at 98 mc.

AUDIO GAIN

Voltage required across the Volume Control to produce 0.1 watt speaker output*** at 400 cycles is .016 volt with Input Selector Switch in BDCST. setting.

*Variations of ± 20% are permissible. All readings made with sufficient input signal to provide 0.5 watt speaker output. 0.5 watt speaker output at 400 cycles is equivalent to a reading of 2.74V. as measured by a high resistance AC voltmeter across the output transformer secondary.

**Detector Plate on AM.

***0.1 watt speaker output at 400 cycles is equivalent to a reading of 1.25 volts as measured by a high resistance AC voltmeter across the voice coil of speaker.

©John F. Rider

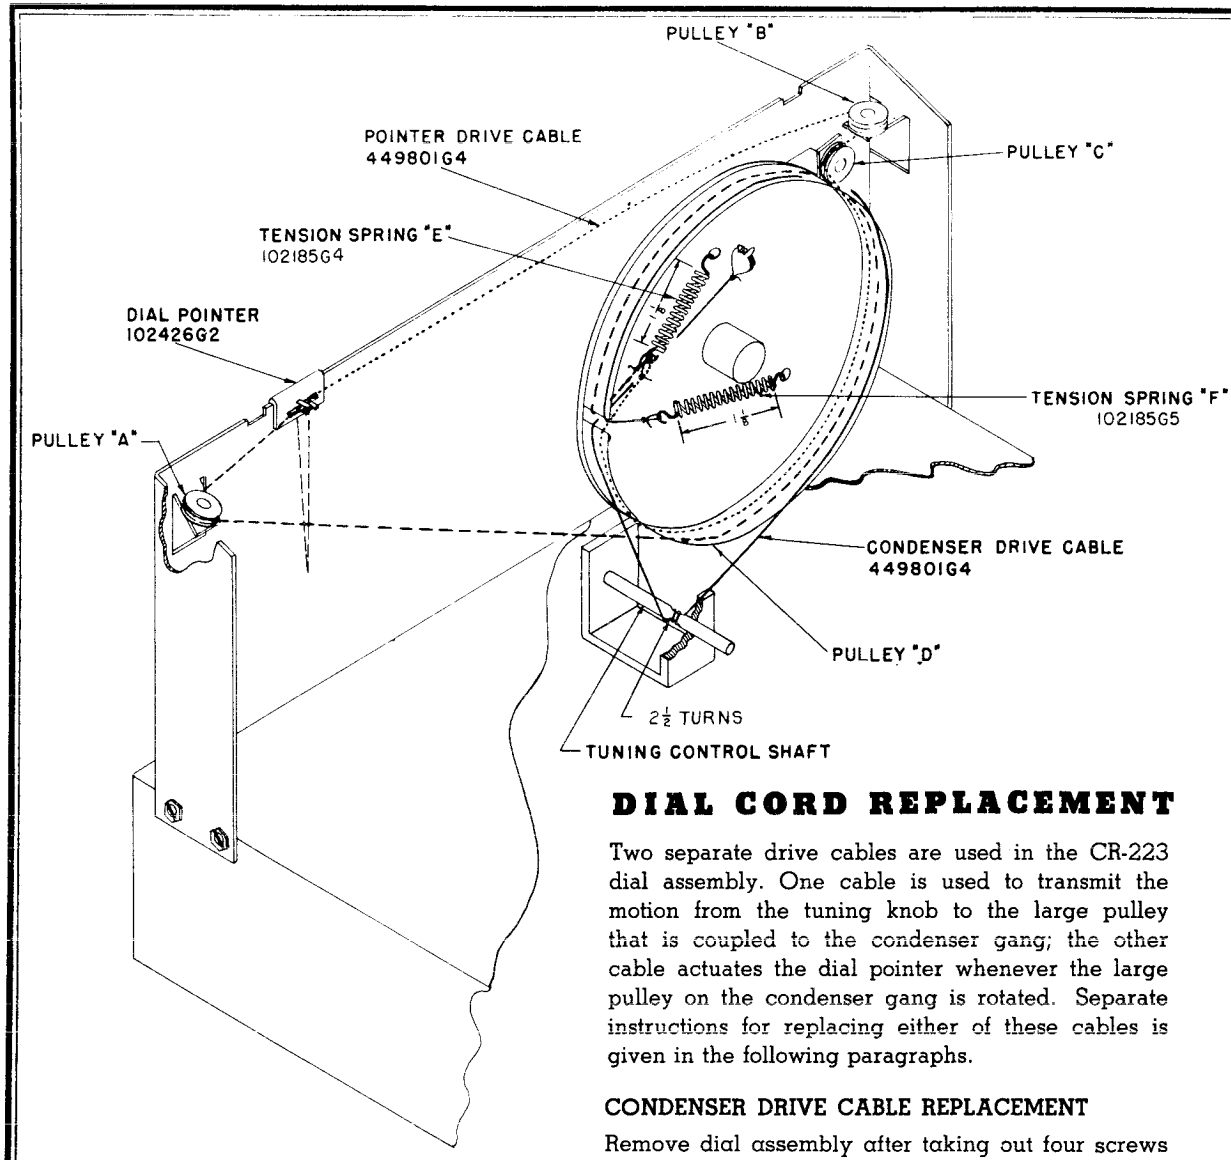

FIGURE 1

DIAL CORD REPLACEMENT

Two separate drive cables are used in the CR-223 dial assembly. One cable is used to transmit the motion from the tuning knob to the large pulley that is coupled to the condenser gang; the other cable actuates the dial pointer whenever the large pulley on the condenser gang is rotated. Separate instructions for replacing either of these cables is given in the following paragraphs.

CONDENSER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slide a short length (approximately ½ inch) of sleeving over one end of a length of dial cable, form a small loop and tie a knot in the manner shown on Figure 1. Tie spring to opposite end of cable making length excluding spring 19½ inches. Hook loop over the metal hook in pulley "D" and lace the cable through the pulley slot and around the pulley in a counterclockwise direction when viewed from the rear of the dial assembly keeping the cable to the rear of the pulley groove. Lace the cable around the smaller diameter portion of the tuning control shaft wrapping 2½ turns *from front to back;* then around the opposite side of pulley "D" into the pulley through the slot. Hook the end of tension spring "F" in the hole provided in pulley "D", completing this operation.

DIAL POINTER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slip a one-half inch length of sleeving over a 42-inch length of dial cable. Tie the two ends to the loop end of the cable spring "E" securely so that the cable doubled measures 19⅝ inches end to end excluding spring.

Place spring hook in top hole and draw cable through slot of pulley "D". Loop one end of cable around pulley "D" in a clockwise direction in front of condenser drive cable (viewing dial assembly from front) then loop the remaining end around pulley in a counterclockwise direction. Secure both ends of cable to chassis at edge of pulley slot with scotch tape, keeping piece of sleeving on remaining loop of cable.

Replace dial assembly and loop cable over pulley "A". While holding cable taut remove scotch tape and loop cable over pulleys "B" and "C" as shown in Figure 1.

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. The short piece of sleeving installed prior to the stringing operation should be slid to the rear of the dial pointer and the crimping lug on the pointer pressed over the sleeving. After checking to make certain that the condenser gang is completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to each end of the sleeving to which the dial pointer is fastened. This completes the operation.

*The part number of the Loop Antenna Assembly changes with different cabinets. It is therefore important that you specify the style number of the instrument when ordering a replacement Loop Antenna Assembly.

©John F. Rider

GENERAL

It frequently becomes necessary to make minor changes in the electrical circuit of a chassis to provide the correct response for different cabinets or speaker systems.

When this becomes necessary such a variation from the original chassis is indicated by a suffix letter; example: 500B.

Whenever necessary Service Bulletin Supplements will be issued with latest schematic drawings and parts lists indicating these changes.

METHOD FOR REMOVING CHASSIS FROM CABINET

Model CR-229 radio chassis is designed for easy removal from the cabinet in which it is installed. As the radio panel is permanently fastened to the chassis, the control knobs need not be removed when the chassis is taken out of the cabinet for service.

To remove the chassis, first remove the antenna leads from their terminals and all plugs from the receptacles on the rear of the chassis. Then remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Lift the rear of the chassis about one inch and pull it straight back. Never remove the chassis tray from the cabinet—it has been properly positioned to bring the radio panel in place when the chassis is replaced. In replacing the chassis, slide it so that the small hooks near the front, ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go and the hook should then engage the slots in the chassis tray. Replace the two Phillips-head screws and nuts and tighten securely. Replace all plugs in their receptacles and the antenna leads on their correct terminals. The antenna terminal board for the loop antenna connections is designated L-H. The two terminals on the loop are designated L and H; the leads connected to these terminals should be wired to the corresponding terminals (L and H) on the chassis.

ALIGNMENT PROCEDURE

Alignment of this receiver requires the use of an accurately calibrated RF signal generator, range 455 kc. to 107 mc., an output meter, and a vacuum tube voltmeter of greater than 10 megohm input impedance. All trimmer condensers can be identified by stampings on the chassis and gang condenser cover and are shown on the chassis layout diagram.

The pointer on the radio dial should line up with the first vertical mark on the low frequency end of the dial glass. If the pointer does not line up, loosen the pointer on the dial string and move it to correct position. Re-tighten and re-cement the pointer to the string. Be sure the gang is fully meshed for this pointer alignment. Align AM first.

AM ALIGNMENT

I-F ALIGNMENT

1. Set volume, treble, and bass controls to maximum. Set Band Switch to Broadcast position, and dial pointer to 1000 kc.
2. Tune the signal generator to EXACTLY 455 kc.
3. Connect output of modulated signal generator to the signal grid of the 6BE6 (pin 7) through a .01 mfd. capacitor and signal generator ground to radio chassis.
4. AM and FM i-f transformers on this model are separate and can be identified on the chassis layout diagram Figure 3.
5. Connect output meter across voice coil of speaker and adjust the i-f transformers for peak output as indicated on the output meter.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Connect 455 kc. sweep generator having approximately 20 kc. sweep to signal grid of 6BE6 (pin 7) through a .01 mfd. capacitor. Connect an oscilloscope through a 1 megohm isolating resistor across the 150,000 ohm diode load resistor. Align for best possible peak and symmetry.

R-F ALIGNMENT

1. Remove the signal generator lead from the 6BE6 grid and connect it across H and L on terminal strip on the rear of the chassis. The high side of the signal generator should be connected to H and the signal generator ground to L.
2. Check the tuning dial pointer adjustment. When the plates of the tuning condenser are completely meshed, the dial pointer must be in line with the last calibration mark at the low frequency end of the dial. If it is not, slide the pointer on its string to the correct position. Be sure to crimp the lugs (on the rear of the pointer) tightly around the string to hold the pointer in adjustment.
3. Set the signal generator and the radio receiver to 1400 kc., adjust the 1400 kc. oscillator trimmer and the 1400 kc. r-f trimmer for maximum output.
4. Set the signal generator and radio receiver to 600 kc. Adjust the oscillator and r-f coil slugs for maximum output. If considerable adjustment was necessary re-check the 1400 kc. trimmer settings.
5. Replace chassis in cabinet and connect loop antenna leads to proper terminals on the rear of the chassis.
6. Form three turns of wire into a loop, connect this loop to the signal generator and loosely couple it to the receiver loop antenna.
7. With the signal generator and dial at 1400 kc., adjust the loop antenna trimmer for maximum output.

©John F. Rider

FM ALIGNMENT

DISCRIMINATOR ALIGNMENT

1. Tune signal generator to EXACTLY 10.775 mc. and connect to pin 4 of the 6SH7 Limiter tube socket through a .01 mfd. capacitor.

2. Connect a DC vacuum tube voltmeter between point "B" on schematic diagram and ground (across .00047 mfd. capacitor—Pin 6 on 6H6 to ground).

3. Peak both discriminator slugs at 10.775 mc.

4. Retune signal generator to exactly 10.7 mc. and adjust bottom slug for zero volts.

5. The DC voltage at 10.625 mc. should be within 10% of the voltage at 10.775 mc. and of opposite polarity.

Note: If the signal generator is not capable of sufficient output to produce a readable DC voltage, the amplification of the last i-f stage can be used to increase the signal input to the limiter for discriminator alignment. To accomplish this, align the last i-f stage as indicated in "IF Alignment". Then align discriminator as above leaving the signal generator connected to the grid of the 6SG7 2nd i-f tube.

I-F ALIGNMENT

1. Connect high side of signal generator, through a .01 mfd. capacitor and a 1000 ohm resistor in series, to pin 4 of the 6SG7 2nd i-f tube. Connect low side of generator to chassis.

2. Close gang condenser and connect vacuum tube voltmeter across 220,000 ohm limiter grid resistor; (Point "A" on schematic to ground). Adjust signal generator output until a reading of at least 3 volts is obtained. In order to reduce regeneration caused by the vacuum tube voltmeter leads, a 1-megohm isolating resistor, connected with as short leads as possible to point "A" should be used in series with the vacuum tube voltmeter. Align the 3rd i-f transformer for best peak as indicated on voltmeter.

3. Repeat above for each succeeding transformer by connecting signal generator to signal grid of first i-f tube 6SG7 then to the signal grid of 6BE6 converter. The i-f stages should be aligned in this order.

WARNING—After each i-f stage has been aligned, do not repeak with the signal into the grid of the 6BE6.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Replace signal generator with sweep generator having approximately 300 kc. sweep and tune generator to 10.7 mc. Connect oscilloscope across 220,000 ohm limiter grid resistor through a 1-megohm isolating resistor. The order of alignment is the same as when using a vacuum tube voltmeter. Each i-f transformer should be individually aligned for best peak and symmetry.

R-F ALIGNMENT

1. Connect vacuum tube voltmeter across limiter grid resistor as in FM I-F alignment.

2. Ground one side of the FM Antenna by placing a wire jumper from one FM connection on the antenna terminal strip to the ground connection.

3. Connect unmodulated signal generator through a 300 ohm resistor to ungrounded antenna post and chassis, and tune signal generator to 107 mc.

4. Set radio dial to 107 mc. and tune oscillator trimmer to peak output on vacuum tube voltmeter. Adjust signal generator output until a reading of at least 3 volts is obtained.

5. Tune 107 mc. r-f and antenna trimmers for maximum indication on voltmeter—it may be necessary to rock the dial while adjusting the r-f trimmer.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor (105) at:

DIAL CORD REPLACEMENT

Two separate drive cables are used in the CR-229 dial assembly. One cable is used to transmit the motion from the tuning knob to the large pulley that is coupled to the condenser gang; the other cable actuates the dial pointer whenever the large pulley on the condenser gang is rotated. Separate instructions for replacing either of these cables is given in the following paragraphs.

CONDENSER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slide a short length (approximately ½ inch) of sleeving over one end of a length of dial cable, form a small loop and tie a knot in the manner shown on Figure 1. Tie spring to opposite end of cable making length excluding spring 19½ inches. Hook loop over the metal hook in pulley "D" and lace the cable through the pulley slot and around the pulley in a counterclockwise direction when viewed from the rear of the dial assembly keeping the cable to the rear of the pulley groove. Lace the cable around the smaller diameter portion of the tuning control shaft wrapping 2½ turns *from front to back;* then around the opposite side of pulley "D" into the pulley through the slot. Hook the end of tension spring "F" in the hole provided in pulley "D", completing this operation.

DIAL POINTER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slip a one-half inch length of sleeving over a 42-inch length of dial cable. Tie the two ends to the loop end of the cable spring "E" securely so that the cable doubled measures 19⅝ inches end to end excluding spring.

Place spring hook in top hole and draw cable through slot of pulley "D". Loop one end of cable around pulley "D" in a clockwise direction in front of condenser drive cable (viewing dial assembly from front) then loop the remaining end around pulley in a counterclockwise direction. Secure both ends of cable to chassis at edge of pulley slot with scotch tape, keeping piece of sleeving on remaining loop of cable.

Replace dial assembly and loop cable over pulley "A". While holding cable taut remove scotch tape and loop cable over pulleys "B" and "C" as shown in Figure 1.

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. The short piece of sleeving installed prior to the stringing operation should be slid to the rear of the dial pointer and the crimping lug on the pointer pressed over the sleeving. After checking to make certain that the condenser gang is completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to each end of the sleeving to which the dial pointer is fastened. This completes the operation.

GENERAL

Model CR-231 radio chassis is an AM-FM tuner that must be used in conjunction with a power amplifier such as the AMP-111 for speaker operation. Heater and plate voltages for the CR-231 radio chassis are supplied from the amplifier chassis; it is therefore essential that the radio and amplifier chassis be interconnected during alignment or for other electrical service operations.

METHOD OF REMOVING CHASSIS FROM CABINET

Model CR-231 radio chassis is designed for easy removal from the cabinet in which it is installed. As the radio panel is permanently fastened to the chassis, the control knobs need not be removed when the chassis is taken out of the cabinet for service.

To remove the chassis, first remove the antenna leads from their terminals and all plugs from the receptacles on the rear of the chassis. Then remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Lift the rear of the chassis about one inch and pull it straight back. Never remove the chassis tray from the cabinet—it has been properly positioned to bring the radio panel in place when the chassis is replaced. In replacing the chassis, slide it so that the small hooks near the front ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go and the hook should then engage the slots in the chassis tray. Replace the two Phillips-head screws and nuts and tighten securely. Replace all plugs in their receptacles and the antenna leads on their correct terminals. The antenna terminal board for the loop antenna connections is designated L-H. The two terminals on the loop are designated L and H; the leads connected to these terminals should be wired to the corresponding terminals (L and H) on the chassis.

ALIGNMENT PROCEDURE

Alignment of this receiver requires the use of an accurately calibrated RF signal generator, range 455 kc. to 107 mc., an output meter, and a vacuum tube voltmeter of approximately 10 megohm input impedance. All trimmer condensers can be identified by stampings on the chassis and gang condenser cover and are shown on the chassis layout diagram.

The pointer on the radio dial should line up with the first horizontal mark on the low frequency end of the dial glass. If the pointer does not line up, loosen the screws on the pointer drive pulley at the end of the tuning gang and adjust the pointer setting; tighten the screws after this adjustment. Be sure the gang is fully meshed for this pointer alignment.

AM ALIGNMENT

I-F ALIGNMENT

1. Set range control to position No. 1. Set volume, treble and bass controls to maximum, the Band Switch to Broadcast position, and dial pointer to 1000 kc.

2. Tune the signal generator to EXACTLY 455 kc.

3. Connect output of modulated signal generator to the signal grid of the 6SB7Y (pin 8) through a .01 mfd. capacitor and signal generator ground to radio chassis.

4. All i-f transformers on this chassis are slug-tuned. Both slug adjustments for 455 kc. are located on top of the transformers; the 10.7 mc. adjustments are accessible on the bottom.

5. Connect output meter across voice coil of 15-inch speaker and peak in order the third, second and first i-f transformers.

6. Use only enough signal input to give a readable indication on voltmeter so that the AVC will not operate and give false readings.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Connect 455 kc. sweep generator having approximately 40 kc. sweep to signal grid of 6SB7Y (pin 8) through a .01 mfd. capacitor. Connect an oscilloscope through a 1 megohm isolating resistor across the 220,000 ohm diode load resistor. Align for best possible peak with range switch in position No. 1, and symmetry in position No. 4.

BROADCAST BAND R-F ALIGNMENT

1. Connect signal generator through .00025 mfd. capacitor to antenna and ground terminals on antenna terminal strip on rear of chassis. Be sure "Ant-loop" switch on top of the chassis is in the ANT. position. Connect output meter as for AM i-f alignment.

© John F. Rider

2. Tune signal generator to 1400 kc.

3. Set dial to 1400 kc. and adjust oscillator, r-f and antenna trimmers for maximum indication on meter.

4. Set signal generator to 600 kc. and tune radio to signal. Adjust the 600 kc. padder to maximum output while simultaneously rocking the gang.

5. 1400 kc. calibration should then be checked and re-adjusted if necessary with the 1400 kc. oscillator trimmer.

SHORT WAVE BAND R-F ALIGNMENT

1. Set the Band Switch to Short Wave and replace the .00025 mfd. capacitor in series with the signal generator lead to the antenna terminal, with a 400-ohm resistor.

2. Set the signal generator and the receiver to 15 mc. and adjust the oscillator, r-f and antenna trimmers for maximum indication on the meter. While adjusting the 15 mc. oscillator trimmer, two peaks may be observed; only one is the correct peak for 15 mc. alignment. To obtain the correct peak, screw trimmer in to maximum capacitance, then decrease until the first peak is observed. This is the correct one.

Another method for checking for the correct peak is to tune the receiver to 15.91 mc. with signal generator at 15 mc. and with the output increased. If the 15 mc. oscillator trimmer is properly adjusted, the signal will be received at 15.91 mc.—if incorrectly aligned, the signal will be received at 14.09 mc.

FM ALIGNMENT

DISCRIMINATOR ALIGNMENT

1. Tune signal generator to EXACTLY 10.775 mc. and connect to pin 4 of the 6SH7 limiter tube socket through a .01 mfd. capacitor.

2. Connect a DC vacuum tube voltmeter from Pin 4 on 6H6 tube socket to ground through a 1 megohm isolating resistor.

3. Peak both discriminator slugs at 10.775 mc.

4. Retune signal generator to exactly 10.7 mc. and adjust bottom slug for zero volts.

5. The DC voltage at 10.625 mc. should be within 10% of the voltage at 10.775 mc. and of opposite polarity.

Note: If the signal generator is not capable of sufficient output to produce a readable DC voltage, the amplification of the last i-f stage can be used to increase the signal input to the limiter for discriminator alignment. To accomplish this, align the last i-f stage as indicated in "IF Alignment". Then align discriminator as above leaving the signal generator connected to the grid of the 6SG7 2nd i-f tube.

I-F ALIGNMENT

1. Connect high side of signal generator, through a .01 mfd. capacitor and a 1000 ohm resistor in series, to pin 4 of the 6SG7 2nd i-f tube. Connect low side of generator to chassis.

2. Close gang condenser and connect vacuum tube voltmeter across 220,000 ohm limiter grid resistor; (Points "A" to "X" on schematic). Adjust signal generator output until a reading of at least 3 volts is obtained. In order to reduce regeneration caused by the vacuum tube voltmeter leads, a 1-megohm isolating resistor, connected with as short leads as possible to point "A" should be used in series with the vacuum tube voltmeter. Align the 3rd i-f transformer for best peak as indicated on voltmeter.

3. Repeat above for the 2nd and 1st transformer by connecting signal generator to signal grid of first i-f tube 6SG7 then to the signal grid of 6SB7Y converter. The i-f stages should be aligned in this order.

WARNING—After each i-f stage has been individually aligned, do not repeak with the signal into the grid of the 6SB7Y.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Replace signal generator with sweep generator having approximately 300 kc. sweep and tune generator to 10.7 mc. Connect oscilloscope across 220,000 ohm limiter grid resistor through a 1-megohm isolating resistor. The order of alignment is the same as when using a vacuum tube voltmeter. Each i-f transformer should be individually aligned for best peak and symmetry.

© John F. Rider

R-F ALIGNMENT

1. Connect vacuum tube voltmeter across limiter grid resistor as in FM I-F alignment. Adjust signal generator output until a reading of at least 3 volts is obtained.

2. Ground one side of the FM Antenna by placing a wire jumper from one FM connection on the antenna terminal strip to the ground connection.

3. Connect unmodulated signal generator through a. 300 ohm resistor to ungrounded antenna post and chassis, and tune signal generator to 107 mc.

4. Set radio dial to 107 mc. and tune oscillator trimmer to peak output on vacuum tube voltmeter.

5. Tune 107 mc. r-f and antenna trimmers for maximum indication on voltmeter—it may be necessary to rock the gang while adjusting the r-f trimmer.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

STAGE GAINS*

Antenna Post to R-F Grid at:
- 600 kc. 5.8
- 6.5 mc. 2.9
- 98 mc. 1.0

R-F Grid to Converter Grid at:
- 600 kc. 11.6
- 6.5 mc. 9.5
- 98 mc. 6.8

R-F on Converter Grid to 455 kc. or I-F Grid at:
- 600 kc. 1.7
- 6.5 mc. 2.4
- 98 mc. 6.8

I-F on Converter Grid to 1st I-F Grid at:
- 455 kc. (dial pointer at 600 kc.) 2.6

1st I-F Grid to 2nd I-F Grid at:
- 455 kc. 20.5
- 10.7 mc. 37

2nd I-F Grid to Limiter Grid at:
- 10.7 mc. 34.5

AUDIO GAIN

Voltage required across the Volume Control to produce 0.1 watt speaker output** at 400 cycles is:
.013 volt with Amplifier AMP-111A
.008 volt with Amplifier AMP-111B or C
with Band Switch in BDCST setting.

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor (105) at:
- 600 kc. ..... 4.5V.
- 6.5 mc. ..... 4.6V.
- 98 mc. ..... 5.4V.

or 0.3 ma. through 15,000 ohm Oscillator Grid Resistor at 600 kc., 0.31 ma. at 6.5 mc. and 0.36 ma. at 98 mc.

*Variations of ± 20% are permissible. All AM readings made with sufficient input signal to provide 0.5 watt speaker output. 0.5 watt speaker output at 400 cycles is equivalent to a reading of 2.75V. as measured by a high resistance AC voltmeter across the voice coil of the 15-inch speaker.

**0.1 watt speaker output at 400 cycles is equivalent to a reading of 1.22 volts as measured by a high resistance AC voltmeter across the voice coil of 15-inch speaker.

10 KC. FILTER ADJUSTMENT

This chassis incorporates a 10 kc. filter circuit to eliminate the beat note heard as a whistle between stations on the broadcast band. If the trimmer is out of adjustment the following procedure should be observed:

1. Adjust the range control switch to the No. 3 setting.

2. Connect the output of an audio oscillator to the phonograph pickup socket. Adjust the oscillator to exactly 10,000 cycles.

3. Set the band selector to PHONO and adjust the 10 kc. trimmer for minimum output.

4. If an audio oscillator is not available for making this adjustment set the band selector to BDCST, set the range control to position 3, connect the antenna to the receiver and set the gang condenser to a point between two stations on adjacent channels having approximately the same power. If the 10 kc. trimmer is out of adjustment, a whistle will be heard. Adjust the trimmer until the whistle is eliminated.

©John F. Rider

DIAL CORD REPLACEMENT

Rotate the brass pulley designated "A" in Figure 1 until the dial pointer strikes the stop at the high frequency end of the dial calibration. In this condition the slot in pulley "A" should be approximately ten degrees to the left of being vertical—see Figure 1. If the slot in the pulley is in some other position under the above mentioned conditions, the pointer set screw is probably loose and has allowed the pointer to slip.

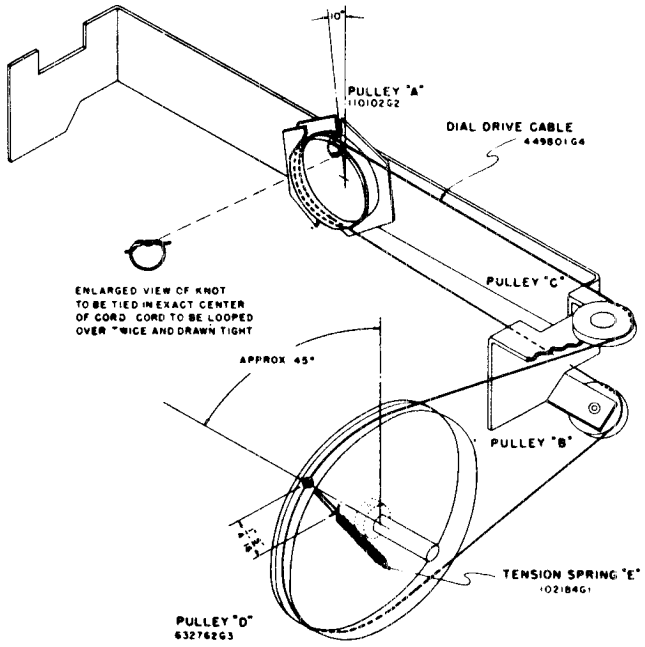

FIGURE 1

To correct this condition, first remove the glass dial and loosen the pointer screw. Then while holding pulley "A" so that its slot is approximately ten degrees to the left of vertical (when viewed from the rear) adjust the pointer until it is resting against the stop at the high frequency end of its travel. Then tighten the pointer set screw securely and replace the glass dial.

Completely unmesh the condenser gang and check the location of the hole or slot in pulley "D." If this hole is not approximately 45 degrees back from vertical as shown on Figure 1, loosen the two No. 6 Allen set screws in the hub of pulley "D" and slip the pulley on its shaft (while holding the condenser gang unmeshed) until the specified adjustment is obtained; then tighten one of the set screws securely. It will be shown later that this is a temporary setting. Next, tie a double knot in the exact center of a 25-inch length of dial cable and fold the cable back on itself so that the knot is at one end. The correct method for tying this knot is shown as an inset on Figure 1. Grasp the cable near the knotted end and slide it into the pulley slot so that the knot is against the inside rim of the pulley as shown in the sketch. The piece of cable nearest the dial frame should be wound in the direction shown for one-half turn; then over the lower pulley "B," around the bottom of the large pulley "D" and into the hole. Pull the cable taut and wrap the end around the small hook on pulley "D" temporarily.

The remaining piece of cable should be wound around pulley "A" in the direction shown, for one complete turn, over the upper pulley "C," and over the top of pulley "D." Thread the end through the small hole in pulley "D" and pull both ends of the cable taut. With one end of tension spring "E" fastened to the hook on pulley "D" lace the two free ends of the cable through the opposite end of the spring and tie a knot at a point that will allow 1/4" to 5/16" of cable between the spring and the inside rim of pulley "D." Be sure to tie the knot around one coil of the spring in the manner shown.

Now with the condenser gang completely meshed, check the position of the dial pointer. If it is not in line with the last calibration mark at the low frequency end of the dial, loosen the set screw in pulley "D" and turn it until the pointer is in the specified position. Be sure that the condenser gang does not move during this adjustment. Then tighten the two screws in pulley "D" securely completing the operation.

©John F. Rider

CONDENSER GANG DRIVE ADJUSTMENTS

Whenever any of the mechanical parts in the condenser gang drive assembly require replacement due to rough handling or for any other reason, it is extremely important that clearances and adjustments shown on Figures 2 and 3 are correct; otherwise, the tuning mechanism will be sluggish or it may slip during operation.

In reassembling the mechanism after any part was replaced, follow the procedure outlined below:

1. Assemble the Tuning Shaft, Drive Collar, Bracket, Tension Spring, Washer, and Flywheel in the order shown on Figure 3. The distance between the front of the Drive Collar and the front of the Tuning Shaft must be $1\frac{1}{8}$ inches as specified on Figure 2. Install

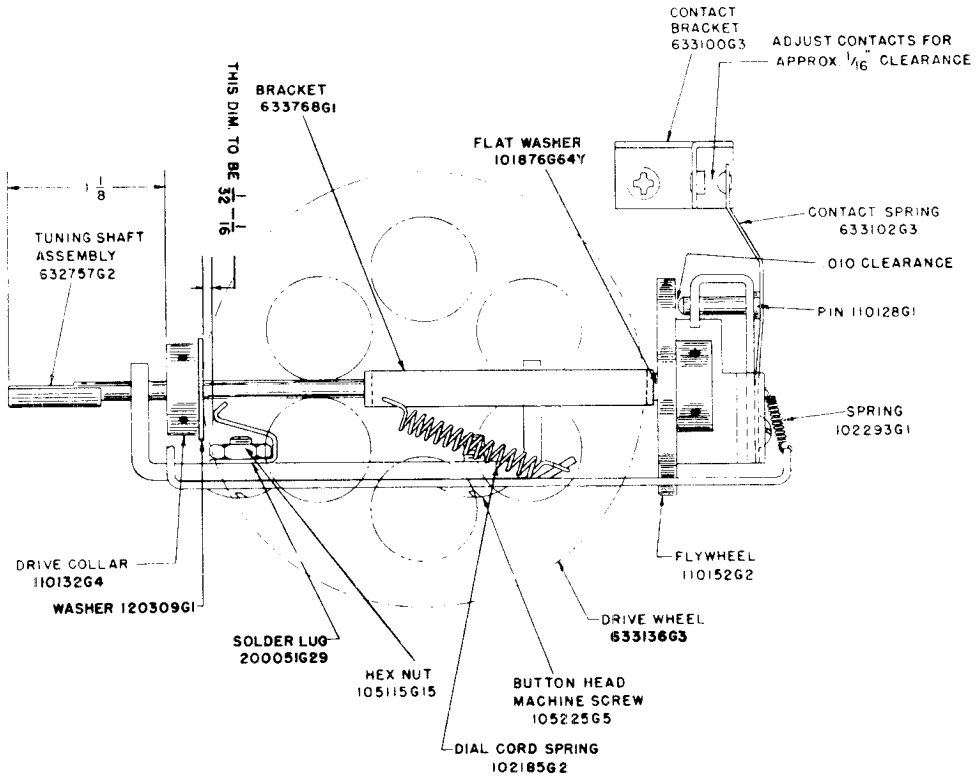

FIGURE 2

the Flywheel on the rear of the Tuning Shaft and slide it forward until it nearly touches the edge of the Drive Wheel; then tighten one of the set screws in the Flywheel hub. Insert a .010" gauge between the Flywheel and the Pin, and while holding the gauge in this position, loosen the set screw in the Flywheel hub that was previously tightened. The Tension Spring should force the Flywheel back against the gauge—when this occurs, tighten both set screws in the Flywheel hub.

2. Adjust the Muting Switch contact clearance by loosening the two screws in the Contact Bracket and sliding the bracket in the required direction until a 1/16" clearance is obtained. If this adjustment cannot be obtained in the manner prescribed, bend the Contact Bracket until proper clearance is realized.

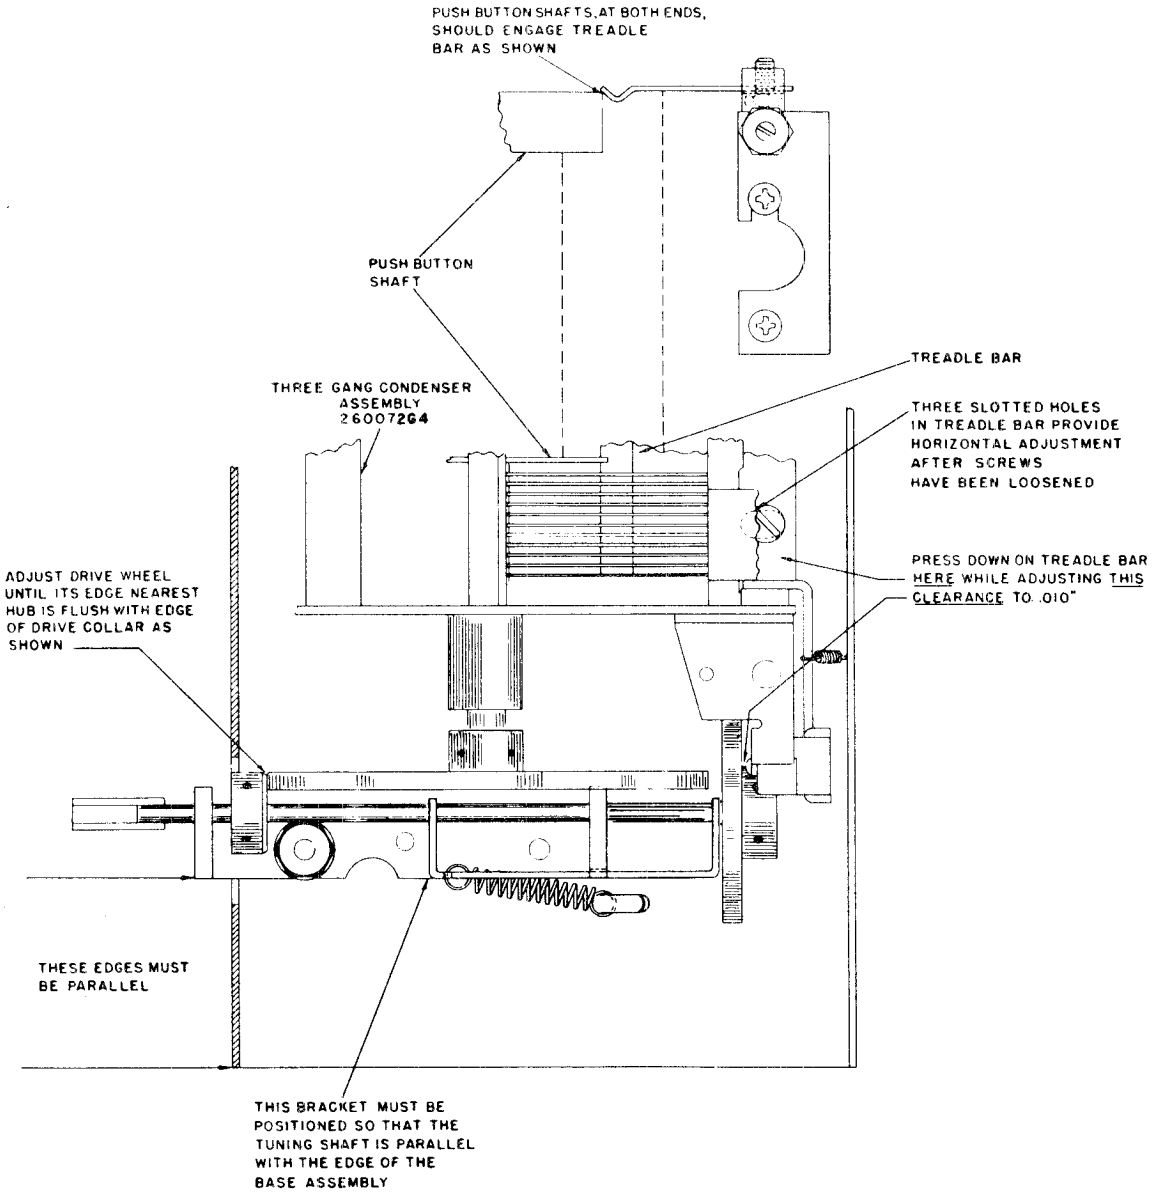
3. The Drive Wheel is properly located on its shaft when its edge nearest the hub is in line with the outside edge of the Drive Collar as shown on Fig-

© John F. Rider

ure 3. Two Allen set screws in the Drive Wheel hub provide a means of adjusting the position of this wheel.

4. When the adjustment outlined in paragraph 2 is correct, the proper contact clearance will automatically be obtained when the Muting Switch is to be "unmuted" while the push buttons are being set. While pressure is applied to any one of the push buttons while they are being set up, a pressure applied simultaneously to the Tuning Control knob will cause the Muting Switch contacts to open. Detailed instructions on setting up these push buttons are shown elsewhere in this bulletin.

5. If the push button shafts at both ends do not engage the Treadle Bar as shown on Figure 3, the three screws in the Treadle Bar must be loosened and the Treadle Bar should be moved until the required condition is obtained.



PUSH BUTTON SHAFTS, AT BOTH ENDS, SHOULD ENGAGE TREADLE BAR AS SHOWN

MODEL CR-233

GENERAL

It frequently becomes necessary to make minor changes in the electrical circuit of a chassis to provide the correct response for different cabinets or speaker systems.

When this becomes necessary such a variation from the original chassis is indicated by a suffix letter; example: 500B.

Whenever necessary Service Bulletin Supplements will be issued with latest schematic drawings and parts lists indicating these changes.

METHOD FOR REMOVING CHASSIS FROM CABINET

Model CR-233 radio chassis is designed for easy removal from the cabinet in which it is installed. As the radio panel is permanently fastened to the chassis, the control knobs need not be removed when the chassis is taken out of the cabinet for service.

To remove the chassis, first remove the antenna leads from their terminals and all plugs from the receptacles on the rear of the chassis. Then remove the two Phillips-head screws from the angular slots in the flange at the rear of the chassis. Lift the rear of the chassis about one inch and pull it straight back. Never remove the chassis tray from the cabinet—it has been properly positioned to bring the radio panel in place when the chassis is replaced. In replacing the chassis, slide it so that the small hooks near the front, ride inside the flanges on the sides of the chassis tray. Push the chassis forward as far as it will go and the hook should then engage the slots in the chassis tray. Replace the two Phillips-head screws and nuts and tighten securely. Replace all plugs in their receptacles and the antenna leads on their correct terminals. The antenna terminal board for the loop antenna connections is designated L-H. The two terminals on the loop are designated L and H; the leads connected to these terminals should be wired to the corresponding terminals (L and H) on the chassis.

ALIGNMENT PROCEDURE

Alignment of this receiver requires the use of an accurately calibrated r-f signal generator, range 455 kc. to 107 mc., an output meter, and a vacuum tube voltmeter of greater than 10 megohm input impedance. All trimmer condensers can be identified by stampings on the chassis and gang condenser cover and are shown on the chassis layout diagram.

The pointer on the radio dial should line up with the first vertical mark on the low frequency end of the dial glass. If the pointer does not line up, loosen the pointer on the dial string and move it to correct position. Re-tighten and re-cement the pointer to the string. Be sure the gang is fully meshed for this pointer alignment. Align AM first.

AM ALIGNMENT

I-F ALIGNMENT

1. Set volume, treble, and bass controls to maximum. Set Band Switch to Broadcast position, and dial pointer to 1000 kc.
2. Tune the signal generator to EXACTLY 455 kc.
3. Connect output of modulated signal generator to the signal grid of the 6BE6 (pin 7) through a .01 mfd. capacitor and signal generator ground to radio chassis.
4. AM and FM i-f transformers on this model are separate and can be identified on the chassis layout diagram Figure 3.
5. Connect output meter across voice coil of speaker and adjust the i-f transformers for peak output as indicated on the output meter.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Connect 455 kc. sweep generator having approximately 20 kc. sweep to signal grid of 6BE6 (pin 7) through a .01 mfd. capacitor. Connect an oscilloscope through a 1 megohm isolating resistor across the 150,000 ohm diode load resistor. Align for best possible peak and symmetry.

R-F ALIGNMENT

1. Remove the signal generator lead from the 6BE6 grid and connect it across H and L on terminal strip on the rear of the chassis. The high side of the signal generator should be connected to H and the signal generator ground to L.

2. Set the signal generator and the radio receiver to 1400 kc., adjust the 1400 kc. oscillator trimmer and the 1400 kc. r-f trimmer for maximum output.

3. Set the signal generator and radio receiver to 600 kc. Adjust the oscillator and r-f coil slugs for maximum output. If considerable adjustment was necessary re-check the 1400 kc trimmer settings.

4. Replace chassis in cabinet and connect loop antenna leads to proper terminals on the rear of the chassis.

5. Form three turns of wire into a loop, connect this loop to the signal generator and loosely couple it to the receiver loop antenna.

6. With the signal generator and dial at 1400 kc., adjust the loop antenna trimmer for maximum output.

© John F. Rider

FM ALIGNMENT

DISCRIMINATOR ALIGNMENT

1. Tune signal generator to EXACTLY 10.775 mc. and connect to pin 4 of the 6SH7 Limiter tube socket through a .01 mfd. capacitor.

2. Connect a DC vacuum tube voltmeter between point "B" on schematic diagram and ground (across .00047 mfd. capacitor—Pin 6 on 6H6 to ground).

3. Peak both discriminator slugs at 10.775 mc.

4. Retune signal generator to exactly 10.7 mc. and adjust bottom slug for zero volts.

5. The DC voltage at 10.625 mc. should be within 10% of the voltage at 10.775 mc. and of opposite polarity.

Note: If the signal generator is not capable of sufficient output to produce a readable DC voltage, the amplification of the last i-f stage can be used to increase the signal input to the limiter for discriminator alignment. To accomplish this, align the last i-f stage as indicated in "IF Alignment". Then align discriminator as above leaving the signal generator connected to the grid of the 6SG7 2nd i-f tube.

I-F ALIGNMENT

1. Connect high side of signal generator, through a .01 mfd. capacitor and a 1000 ohm resistor in series, to pin 4 of the 6SG7 2nd i-f tube. Connect low side of generator to chassis.

2. Close gang condenser and connect vacuum tube voltmeter across 220,000 ohm limiter grid resistor; (Point "A" on schematic to ground). Adjust signal generator output until a reading of at least 3 volts is obtained. In order to reduce regeneration caused by the vacuum tube voltmeter leads, a 1-megohm isolating resistor, connected with as short leads as possible to point "A" should be used in series with the vacuum tube voltmeter. Align the 3rd i-f transformer for best peak as indicated on voltmeter.

3. Repeat above for each succeeding transformer by connecting signal generator to signal grid of first i-f tube 6SG7 then to the signal grid of 6BE6 converter. The i-f stages should be aligned in this order.

WARNING—After each i-f stage has been aligned, do not repeak with the signal into the grid of the 6BE6.

ALTERNATE VISUAL ALIGNMENT OF I-F STAGES

1. Replace signal generator with sweep generator having approximately 300 kc. sweep and tune generator to 10.7 mc. Connect oscilloscope across 220,000 ohm limiter grid resistor through a 1-megohm isolating resistor. The order of alignment is the same as when using a vacuum tube voltmeter. Each i-f transformer should be individually aligned for best peak and symmetry.

R-F ALIGNMENT

1. Connect vacuum tube voltmeter across limiter grid resistor as in FM I-F alignment.

2. Ground one side of the FM Antenna by placing a wire jumper from one FM connection on the antenna terminal strip to the ground connection.

3. Connect unmodulated signal generator through a 300 ohm resistor to ungrounded antenna post and chassis, and tune signal generator to 107 mc.

4. Set radio dial to 107 mc. and tune oscillator trimmer to peak output on vacuum tube voltmeter. Adjust signal generator output until a reading of at least 3 volts is obtained.

5. Tune 107 mc. r-f and antenna trimmers for maximum indication on voltmeter—it may be necessary to rock the dial while adjusting the r-f trimmer.

SPECIAL SERVICE INFORMATION

The following information is provided for the service man who has a vacuum tube voltmeter or a similar measuring instrument available.

OSCILLATOR OUTPUT VOLTAGE

The DC voltage developed across the Oscillator Grid Resistor (105) at:

600 kc. ..... 6.6V.
98 mc. ..... 6.0V.

or 0.3 ma. through 22,000 ohm Oscillator Grid Resistor at 600 kc. and 0.27 ma. at 98 mc.

AUDIO GAIN

Voltage required across the Volume Control to produce 0.1 watt speaker output*** at 400 cycles is .012 volt with Input Selector Switch in BDCST. setting.

*Variations of ±20% are permissible. All readings made with sufficient input signal to provide 0.5 watt speaker output. 0.5 speaker output at 400 cycles is equivalent to a reading of 1.25V. as measured by a high resistance AC voltmeter across the voice coil of the speaker.
**Detector Plate on AM.
***0.1 watt speaker output at 400 cycles is equivalent to a reading of 0.55 volts as measured by a high resistance AC voltmeter across the voice coil of speaker.

DIAL CORD REPLACEMENT

Two separate drive cables are used in the CR-233 dial assembly. One cable is used to transmit the motion from the tuning knob to the large pulley that is coupled to the condenser gang; the other cable actuates the dial pointer whenever the large pulley on the condenser gang is rotated. Separate instructions for replacing either of these cables is given in the following paragraphs.

CONDENSER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slide a short length (approximately ½ inch) of sleeving over one end of a length of dial cable, form a small loop and tie a knot in the manner shown on Figure 1. Tie spring to opposite end of cable making length excluding spring 19½ inches. Hook loop over the metal hook in pulley "D" and lace the cable through the pulley slot and around the pulley in a counterclockwise direction when viewed from the rear of the dial assembly keeping the cable to the rear of the pulley groove. Lace the cable around the smaller diameter portion of the tuning control shaft wrapping 2½ turns *from front to back;* then around the opposite side of pulley "D" into the pulley through the slot. Hook the end of tension spring "F" in the hole provided in pulley "D", completing this operation.

DIAL POINTER DRIVE CABLE REPLACEMENT

Remove dial assembly after taking out four screws on each side of chassis. Slip a one-half inch length of sleeving over a 42-inch length of dial cable. Tie the two ends to the loop end of the cable spring "E" securely so that the cable doubled measures 19⅝ inches end to end excluding spring.

Place spring hook in top hole and draw cable through slot of pulley "D". Loop one end of cable around pulley "D" in a clockwise direction in front of condenser drive cable (viewing dial assembly from front) then loop the remaining end around pulley in a counterclockwise direction. Secure both ends of cable to chassis at edge of pulley slot with scotch tape, keeping piece of sleeving on remaining loop of cable.

Replace dial assembly and loop cable over pulley "A". While holding cable taut remove scotch tape and loop cable over pulleys "B" and "C" as shown in Figure 1.

Turn the tuning control shaft until the condenser gang is completely meshed and slide the dial pointer on its track until it is in line with the last calibration mark at the low frequency end of the dial. The short piece of sleeving installed prior to the stringing operation should be slid to the rear of the dial pointer and the crimping lug on the pointer pressed over the sleeving. After checking to make certain that the condenser gang is completely meshed and the dial pointer is in the position specified previously, apply a few drops of cement to each end of the sleeving to which the dial pointer is fastened. This completes the operation.

MODEL 7FM867,
Ch. 7C13D

ALIGNMENT

Before aligning, set the dial pointer as follows: close the tuning gang condenser (plates fully closed). Set pointer in line with the last mark at the low frequency end of the dial scale. Set volume control on full, keep the signal output as low as possible to prevent AVC action and false readings.

STEP DUMMY ANT. TEST OSC.

STEP	DUMMY ANT.	TEST OSC. CONNECTION	TEST OSC. FREQUENCY	RECEIVER DIAL	ADJUST	REMARKS
1	.01 mf.	Ant.	455KC Modulated	Any quiet spot	D-C-B-A for max. output	Repeat in reverse order
2	--	*Loop	1500KC Modulated	150	C2F for max. output	--
3	--	*Loop	1500KC Modulated	150	C1 for max. output	Rock Gang while tuning
4	300 ohms.	*FM terminals	19M.C. Unmodulated	Any quiet spot	L3 for min. output	Min. noise in speaker
5	300 ohms	FM terminals	104M.C. Unmodulated	104	C2h for min. output	Min. noise in speaker
6	300 ohms	FM terminals	104M.C. Unmodulated	104	C2g for min. output	Rock Gang while tuning

*All Steps: Connect output meter across speaker.
Step 2 & 3: Make a 2 turn loop & connect to signal generator. Loosely couple the 2 turn loop to receiver loop.
Step 4: Disconnect lug if present from FM dipole terminal. Connect hot side of generator through 300 ohm resistor to dipole terminal where lug was connected.

ALIGNMENT

OPERATION	CONNECT TEST OSCILLATOR TO	DUMMY ANTENNA	INPUT SIGNAL FREQUENCY	BAND	SET DIAL TO	ADJUST TRIMMERS	PURPOSE
1	Stator Plates of C3d	.05mfd.	455 KC	BC	600 KC	L12, L13, L16, L17, L20, L21	Align if channel for maximum output.
2	Stator Plates of C3d	.05mfd.	455 KC Modulated	BC	600 KC	C8	Adjust wave trap for maximum output.
3	2 TURNS 8" DIAMETER COUPLED LOOSELY TO LOOP ANTENNA	------	1500 KC Modulated	BC	1500 KC	C10	Set oscillator to dial scale.
4		------	1500 KC Modulated	BC	1500 KC	C7	Align antenna for maximum output.
5		------	600 KC Modulated	BC	600 KC	C9	Rock gang to track BC padder
6(a)	Pin 4 (Grid) on 6SH7 Limiter Socket	.05mfd.	10.7 MC Unmodulated	FM	------	L22 Coil Slug Primary Discriminator	Align Primary of discriminator for maximum reading.
7(b)	Pin 4 (Grid) on 6SH7 Limiter Socket	.05mfd.	10.7 MC Unmodulated	FM	------	L23 Coil Slug Secondary Discriminator	Adjust secondary of discriminator for zero reading.
8(c)	Pin 4 (Grid) on 6SG7 2nd IF Socket	.05mfd.	10.7 MC Unmodulated	FM	------	L18 and L19, Pri. and Sec. 3rd IF Coil	Align 3rd IF Transformer for maximum reading.
9(c)	Pin 4 (Grid) on 6SG7 1st IF Socket	.05mfd.	10.7 MC Unmodulated	FM	------	L14 and L15 Pri. and Sec. 2nd IF Coil	Align 2nd IF Transformer for maximum reading.
10(c)	Lug "B" on Coil L4	.05mfd.	10.7 MC Unmodulated	FM	------	L10 and L11 Pri. and Sec. 1st IF Coil	Align 1st IF Transformer for maximum reading.
11(c)	Antenna Terminals	300ohm Resistorr	106 MC Unmodulated	FM	106 MC	C12 Oscillator Trimmer	Set oscillator to dial scale.
12(c)	Antenna Terminals	300ohm Resistor	106 MC Unmodulated	FM	106 MC	C4 Antenna Trimmer	Align antenna stage for maximum reading.
13(c)	Antenna Terminals	300ohm Resistor	88 MC Unmodulated	FM	88 MC	L6 Oscillator Slug	Set Oscillator to dial scale.
14(c)	Antenna Terminals	300ohm Resistor	88 MC Unmodulated	FM	88 MC	L4, L2 Slugs	Align Antenna and RF stages for maximum reading.
15(c)	Antenna Terminals	Repeat steps 11, 12, 13, and 14 until tracking is perfect at 88 and 106 MC.					

IMPORTANT: Alignment of this chassis will in most cases be unnecessary unless an IF or RF transformer is replaced or the adjustment has been tampered with. A vacuum tube voltmeter must be used for FM alignment. An AC output meter connected across the primary or secondary of the output transformer will be satisfactory for all AM adjustments. The signal generator output should be kept just high enough to get an indication on the meter.

NOTES: (a) Vacuum tube voltmeter pin "A" on discriminator transformer to chassis (half discriminator load).
(b) Vacuum tube voltmeter pin 1 of test jack to chassis (full discriminator load).
(c) Vacuum tube voltmeter pin 3 of test jack to chassis (limiter grid load).

A much more satisfactory IF and discriminator alignment may be obtained by using a 10.7 MC signal generator, frequency modulated at an audio frequency and swept approximately 600 KC (±300 KC). An oscilloscope should be connected to test jack pin 3 and all IF slugs adjusted for a symetrical pattern of highest amptitude. See Fig. 1. For discriminator alignment, connect oscilloscope to test jack pin 1 and adjust T4 for highest linear symetrical pattern. See Fig. 2.

ALIGNMENT

OPERATION	CONNECT OSCILLATOR TO	DUMMY ANTENNA	INPUT SIGNAL FREQUENCY	BAND	SET DIAL AT	TRIMMERS	PURPOSE
1	Conv. Grid	.01mfd	455 KC	BC	600 KC	T2,T3 Bottom	Align I.F.'s
2	ONE TURN LOOP MADE WITH GENERATOR LEADS		455 KC	BC	600KKC	C81	I.F. trap adjustment for minimum I.F. signal
3			1500 KC	BC	1500 KC	C58	Set BC osc. to scale at 1500 KC
4			1500 KC	BC	1500 KC	C62,C72	Align BC RF. and Loop
5			600 KC	BC	600 KC	C57	Rock Gang to track BC padder
6	A1-Gnd.	400ohn	15 MC	SW	15 MC	C59	Scale osc. at 15 MC
7	A1-Gnd.	400ohn	15 MC	SW	15 MC	C63,C69	Align SW RF and Ant.
8	6SG7 2nd I.F. Grid	.01mfd.	10.7 MC	FM	88 MC	T4 top	Align for max. voltage at test jack pin 3 Rock gen. over 10.7 MC to check for symmetrical I.F.. response.
9	6SG7 1st. I.F. Grid	.01mfd.	10.7 MC	FM	88 MC	T3 top	Align for max. voltage at test jack pin 3 Rock gen. over 10.7 MC to check for symmetrical I.F. response.
10	Converter	.01mfd.	10.7 MC	FM	88 MC	T2 top	Align for max. voltage at text jack pin 3 Rock gen. over 10.7 MC to check for symmetrical I.F. response. Re-check peaking of T4, and T3.
11	Converter grid 6BE6	.01mfd.	10.7 MC	FM	88 MC	T5 primary	Align for max. voltage across ½ discriminator Load (un-used Lug bottom of T5 to ground)
12	Converter grid 6B6E	.01mfd.	10.7 MC	FM	88 MC	T5 secondary	Align for zero voltage across full discriminator load (Test jack pin 1 to ground)
13	FM ant.term.	direct	108 MC	FM	108 MC	C10	Scale OSC at 108 MC (max. voltage Test jack pin 3.
14	FM ant.term.	direct	108 MC	FM	108 MC	C8,C3	Align FM RF and Ant. (max. voltage Test jack pin 3.
15	FM ant.term.	direct	88 MC	FM	88 MC	L4	Scale osc. at 88 MC.
16	FM ant.term.	direct	88 MC	FM	88 MC	L3,T1	Align RF and Ant. at 88 MC repeat steps 13, 14, 15, 16 as necessary.

NOTE: 1. A much more satisfactory IF and discriminator alignment may be obtained by using a 10.7 MC Signal generator frequency modulated at an audio frequency and swept approximately 600 KC (±300 KC). An oscilloscope should be connected to Test jack pin 3 and all IF screws adjusted for a symmetrical pattern of highest amptitude. See Fig. 1. For discriminator alignment, connect scope to Test jack pin 1 and adjust T5 for highest symmetrical pattern. See Fig. 2.

NOTE: 2. In all FM alignment calling for a voltage measurement at Test jack pin 3 (limiter grid resistor) keep signal generator output to such a value as will result in approximately 2 volts measured with a vacuum Tube voltmeter such as the Voltohmyst, Vomax or equiv.

S2	11-59	Band switch (pilot lites & audio)
S3	.....	Part of Tone control assembly, A.C. switch.
T1	3-183	F.M. antenna transformer.
T2	3-173	1st I.F. transformer.
T3	3-174	2nd I.F. transformer.
T4	3-175	3rd I.F. transformer.
T5	3-176	Discriminator transformer
T6	2-9	Power Transformer (1st. run).
T6	2-19	Power Transformer (2nd. run).
T7	3-186	B.C.-S.W. R.F. transformer.
T8	3-185	S.W. antenna transformer.
T9	52-58	Output transformer (part of speaker ass'y.)
	15-81	Tube socket (octal)
	15-87	Phono pick-up socket.
	15-135	Phono A.C. receptacle socket.
	26-2	Dial lite (#47 brown bead).
	26-7	Dial lite (#44 blue bead)
	16-34	Tube shield for 6BA6 & 6BE6 tubes
	135-35	Dial pointer ass'y.
	138-15	Dial scale separater.
	129-56	Dial cord tension spring.
	S1329	Dial cord, 62 inches long (#134-7).
	S1328	Dial cord (for condenser gang).
	S1863	R.F. shelf & tuning condenser ass'y.
	117-63	Dial scale F.M.
	117-90	Dial scale B.C.
	117-91	Dial scale S.W.
	**22-58	Speaker, 12" complete with output transformer
	115-62	Cabinet, combination console (Specify color) — Walnut; Mahogany; Blond
	S-1610	Cabinet dipole antenna ass'y.
	21-15	Record changer VM-400 (1st. run).
	21-37	Record changer VM-402 (2nd. run).
	122-53	Dial escutcheon clamp
	122-54	Escutcheon glass (large).
	117-103	Dial Masking plate.
	128-89	Knob, (tone, tuning, volume).
	128-90	Knob, Band switch).
	129-46	Spring, for band switch knob.

** Speakers marked with a BLUE X have a change of wiring; ref; speaker plug and chassis socket, pin #2 interchanged with pin #5. Change refers to EARLY RUN SETS ONLY.

ALIGNMENT

OPERATION	CONNECT OSCILLATOR TO	DUMMY ANTENNA	INPUT SIGNAL FREQUENCY	BAND	SET DIAL AT	TRIMMERS	PURPOSE
1	Conv. Grid	.01mfd	455 KC	BC	600 KC	T2,T3 Bottom	Align I.F.'s
2	ONE TURN LOOP MADE WITH GENERATOR LEADS		455 KC	BC	600KKC	C81	I.F. trap adjustment for minimum I.F. signal
3			1500 KC	BC	1500 KC	C58	Set BC osc. to scale at 1500 KC
4			1500 KC	BC	1500 KC	C62, C72	Align BC RF. and Loop
5			600 KC	BC	600 KC	C57	Rock Gang to track BC padder
6	A1-Gnd.	400ohn	15 MC	SW	15 MC	C59	Scale osc. at 15 MC
7	A1-Gnd.	400ohn	15 MC	SW	15 MC	C63, C69	Align SW RF and Ant.
8	6SG7 2nd I.F. Grid	.01mfd.	10.7 MC	FM	88 MC	T4 top	Align for max. voltage at test jack pin 3 Rock gen. over 10.7 MC to check for symmetrical I.F. response.
9	6SG7 1st. I.F. Grid	.01mfd.	10.7 MC	FM	88 MC	T3 top	Align for max. voltage at test jack pin 3 Rock gen. over 10.7 MC to check for symmetrical I.F. response.
10	Converter	.01mfd.	10.7 MC	FM	88 MC	T2 top	Align for max. voltage at text jack pin 3 Rock gen. over 10.7 MC to check for symmetrical I.F. response. Re-check peaking of T4, and T3.
11	Converter grid 6BE6	.01mfd.	10.7 MC	FM	88 MC	T5 primary	Align for max. voltage across ½ discriminator Load (un-used Lug bottom of T5 to ground)
12	Converter grid 6B6E	.01mfd.	10.7 MC	FM	88 MC	T5 secondary	Align for zero voltage across full discriminator load (Test jack pin 1 to ground)
13	FM ant.term.	direct	108 MC	FM	108 MC	C10	Scale OSC at 108 MC (max. voltage Test jack pin 3.
14	FM ant.term.	direct	108 MC	FM	108 MC	C8,C3	Align FM RF and Ant. (max. voltage Test jack pin 3.
15	FM ant.term.	direct	88 MC	FM	88 MC	L4	Scale osc. at 88 MC.
16	FM ant.term.	direct	88 MC	FM	88 MC	L3,T1	Align RF and Ant. at 88 MC repeat steps 13, 14, 15, 16 as necessary.

NOTE: 1. A much more satisfactory IF and discriminator alignment may be obtained by using a 10.7 MC Signal generator frequency modulated at an audio frequency and swept approximately 600 KC (±300 KC). An oscilloscope should be connected to Test jack pin 3 and all IF screws adjusted for a symmetrical pattern of highest amptitude. See Fig. 1. For discriminator alignment, connect scope to Test jack pin 1 and adjust T5 for highest symmetrical pattern. See Fig. 2.

NOTE: 2. In all FM alignment calling for a voltage measurement at Test jack pin 3 (limiter grid resistor) keep signal generator output to such a value as will result in approximately 2 volts measured with a vacuum Tube voltmeter such as the Voltohmyst, Vomax or equiv.

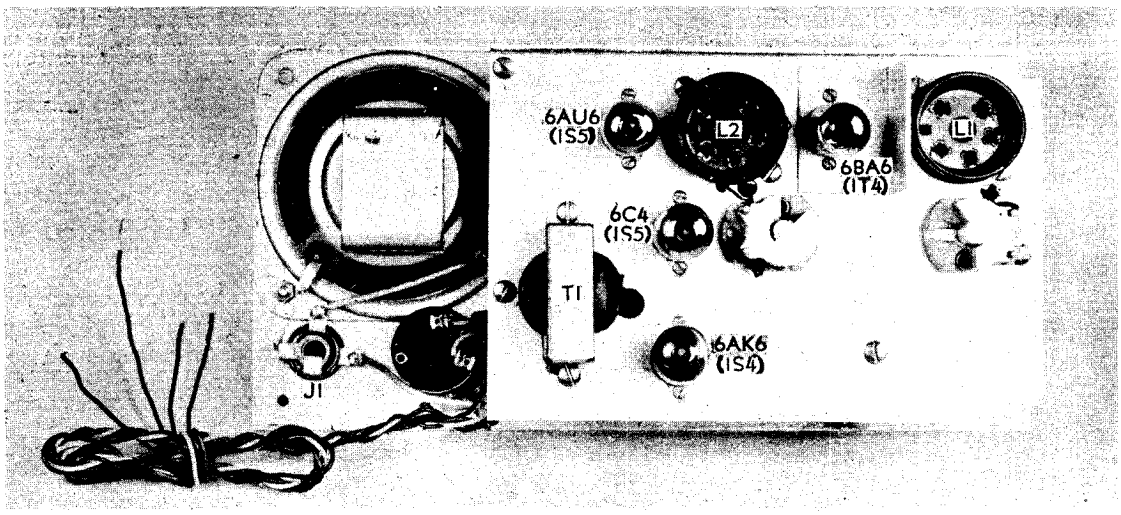
MODEL 801



DESCRIPTION: Model 801 Receivers hew rigorously to the line of maximum sensitivity and general utility for the minimum of tubes, circuits and power consumption. They differ only in power requirements and frequency range. Model 801 employs new miniature 6.3 volt heater tubes for operation from batteries or a.c. power supply.

The two circuit diagrams show the basic similarity of the two models. Each consists of a high-gain pentode r.f. amplifier stage tuned by L1 and C1, the latter controlled by the ANT. knob. On short waves the tuning of this r.f. stage is not particularly critical, and the ANT. knob may be regarded as a trimmer rather than as a second tuning control. Following the r.f. amplifier is a pentode regenerative detector. It's tuned circuit is L2, C1a. At and around critical regeneration, detector tuning is very sharp. C1a is controlled by the main dial marked TUNE upon the panel. Connected to C1a through 16:1 preloaded gears, the main dial makes eight revolutions for each tuning range to yield 800 well-spaced dial divisions per band. Revolutions of this dial are counted by a secondary dial numbered 0 through 8, with the number of dial turns in use indicated by the figure visible through the panel window at the upper left of the dial. Logging of stations received is effected by noting down the numbers of the coils in use at L1 and L2; the setting of the ANT. knob and the window-visible number followed by the TUNE dial setting. Setting of the REG. knob may also be recorded, since it affects TUNE dial setting slightly.

Detector regeneration is controlled by varying screen voltage by means of P1. Regenerative tickler is in detector plate circuit, with a.f. load R5 isolated from r.f. by two-section filter C3, R2, C3A. This method of control gives extremely smooth variation of regeneration just below, at and immediately beyond critical regeneration. Stickiness, drag and fringe-howl are pleasingly absent.

The detector is followed by a.f. VOLume control P2 and two stages of high-gain pentode audio amplification. The 2nd (power output) stage feeds the self-contained loud-speaker: unless a 2-circuit phone plug is inserted in the PHONES jack when the speaker is muted and output fed through the plug to headphones.

ACCESSORIES REQUIRED: Accessories required, but not supplied, to put either receiver into operation are as follows:

MODEL 801: Antenna and ground - antenna may be a single wire about 50 ft. long plus 20 to 30 ft. of leadin, and well up in the air. Ground connection should be to a cold water pipe scraped bare at point of connection.

1 each 6BA6, 6AU6, 6C4 and 6AK6 tubes

1 a.c. power supply furnishing 6.3 volts at .9 amperes and 180 volts at 35 ma. filtered d.c. ——or storage or dry batteries (4 Burgess #4FA, or equal, 1½ volt batteries connected in series to provide 6 volts for tube heaters and 4 Burgess #5308, or equal, 45 volt "B" batteries in series to provide 180 volts).

INSTALLATION: Insert tubes in sockets as indicated in rear-view illustration. Erect antenna using #14 to #18 bare, enameled or insulated wire as high and clear of surrounding objects as practicable. If a single wire is used, fasten far end to glass or ceramic insulator fastened to tree, pole or building with rope. Thread leadin end of antenna wire through second insulator, twist back on itself, and carry free end of wire down to receiver (antenna and leadin one piece of wire). Fasten second insulator to tree, pole or building as convenient with rope. Keep antenna and leadin free and clear of nearby objects. Connect leadin to wire projecting from receiver and terminated at #2 contact of L1 socket (upper left, as seen from front).

Insert coils for desired frequency range in L1 and L2 sockets. NOTE that while the two coils for each range are identical, small electrical differences will affect dial logging if they are interchanged. Therefore, scratch identifying marks, such as "L1", "L2" upon each coil of each pair so as to be sure to get the same coil in the same socket every time.

©John F. Rider

MODEL 801

Connect batteries to MODEL 801 receiver (a.c. power supply to MODEL 801 only) by means of color-coded twisted cable projecting from receiver cabinet. Follow wire colors and connection legend found at bottom of appropriate circuit diagram. Connect ground lead to BLACK receiver cable wire at battery or a.c. power supply connection point. ON-OFF switch in YELLOW wire opens filament circuit of Model 801B; switch in RED wire of Model 801 opens B+ circuit when REG. knob is turned to OFF.

OPERATION: Set ANT. knob to about 50, TUNE dial to about 4-0, set VOL. knob to about 10. Advance REG. knob slowly from OFF toward 10, listening carefully for the beginning of a faint rushing sound in the speaker. Advance REG. knob to just beyond the point where this rushing noise is just heard, and which indicates that the detector has passed the point of critical regeneration and has gone into oscillation. Rotate TUNE dial slowly until a squeal is heard evidencing reception of a signal. If this squeal is broken up into dots and dashes it is a CW telegraph station: if the squeal is continuous, it is a broadcast or phone station.

Adjust ANT. knob for loudest signal. Carefully adjust TUNE dial and REG. knob for loudest telegraph signal. Adjust VOL. knob for desired loudness of signal.

To initially locate phone or broadcast stations, proceed as above (REG. knob advanced so signal is first heard as a continuous uninterrupted squeal). Once the signal is so found, retard REG. knob together with the slight adjustment of TUNE dial required to "hold" the signal until the detector stops oscillating, the squeal disappears, and voice or music is heard.

Greatest sensitivity and selectivity obtains when the REG. knob is advanced to just above the point at which a signal is heard as a squeal when it is a CW telegraph signal. Greatest sensitivity and selectivity for phone, broadcast and modulated telegraph reception obtains when REG. knob is set to just below the point where such signals turn into squeals. The range of mechanical movement of the REG. knob is much greater than its useful electrical range. Its useful operating range is from just below to just above the point where signals are heard as squeals. This point will move about upon the REG. scale for different coils and different frequencies. ALWAYS operate with REG. knob just below signal-squeal point for phone, just above for CW telegraph reception. DO NOT control volume with REG. knob — control volume with VOL. knob.

As with all t.r.f.-regenerative detector receivers, selectivity is a function of REGeneration setting, is greatest for weak signals and at critical regeneration. For the regular broadcast band selectivity is adequate to separate weak distant from strong local stations only when using a very short antenna—maybe 10 to 15 ft. long. The 50 ft. antenna may be electrically shortened by disconnecting it metalically from the receiver antenna lead, then twisting the leadin about the insulated receiver antenna wire for a couple of turns — just enough to give maximum selectivity without serious loss of sensitivity. On short waves this problem is not particularly serious, and good selectivity will usually obtain with a 50 ft. antenna. Good reception can be had with a shorter antenna in most cases, however.

PHONES jack is for private listening — does not yield more volume than loud speaker. If more volume on headphones is desired the receiver output circuit may be altered upon addition of a 10,000 ohm, 1 watt resistor and a .1 mfd., 400 volt tubular condenser. To make such alteration disconnect lead of T1 going to long spring of J1: disconnect short spring of J1 from speaker voice-coil lug. Connect freed lead of T1 directly to speaker voice-coil lug, leaving both lugs of J1 momentarily unconnected. Disconnect lead of T1 going to plate of 6AK6 (or 1S4) tube socket and connect this lead to short spring of J1. Connect long spring of J1 to one lead of .1 mfd. condenser: other lead of condenser to plate lug of 6AK6 (or 1S4) socket. Connect 10,000 ohm resistor between plate lug of 6AK6 (or 1S4) socket and receiver B+ circuit (to B+ 180 V. for Model 801; to B+ 90 V. for Model 801B).

NOTE: At and around critical REGeneration the detector circuit is extremely sharp in tuning. Upon loud signals from the loud speaker mechanical vibration feedback between speaker and C1a may occur. This may cause howling, with howl masking signal. Do not turn VOL. knob up so signal becomes loud enough to cause such feedback — or use headphones for reception.

ALTERNATE ANTENNA: If it is desired to use a 1/2-wave doublet, or other antenna having a two-wire leadin, disconnect contact #1 from contact #3 on L1 socket. Connect two-wire leadin to L1 socket contacts #1 and #2. Use or omit ground connection to water-pipe ground as results dictate.

MODEL 802

DESCRIPTION: Model 802 receiver is designed to cover the 80, 40, 20, 16, 11/10 and 6 meter amateur bands only. Following A.R.R.L. Handbook teachings thru employment of controllable regeneration in its 735 kc. i.f. amplifier to provide extreme and variable selectivity, its excellence in this respect is equalled by the extreme of band-spread it provides upon each amateur band. Five new miniature u.h.f. tubes, three of them dual-function, yield effective 8-tube complement. Each amateur band occupies the major portion of the eight-revolution, 0/100 division 3½" diameter main tuning dial, which with the secondary "turn-counting" dial visible thru the panel window gives 88" of effective dial length. A series-valve noise-limiter is effective in reducing ignition and other noise interference. Noise control, P3, is accessible upon the interior channel upon lifting cabinet lid.

The circuit consists basically of a 6BE6 pentagrid converter having antenna input circuit L1 inductively tuned by the relatively non-critical ANT. knob, and local heterodyne oscillator with inductive tuning of L2 by the main TUNE dial. A single stage of dual-air-tuned i.f. amplification employs a 6BA6 tube, with regeneration controlled by REG. knob P1, (which also carries an on-off switch for control of external power supply). A 6J6 dual triode functions as non-loading infinite impedance second detector and series-valve noise-limiter. This is followed by a second 6J6 functioning as first a.f. amplifier and beat-oscillator, pitch of which may be adjusted for single-signal CW reception by internal air capacitor C5d. A.f. power amplifier is a 6AK6, with VOLume controlled by P2. A PM dynamic speaker and output transformer T1 are built into Model 802, together with headphone jack J1. Band change is effected by inserting appropriate plug-in coils in sockets accessible upon lifting cabinet lid. Coils are individually adjusted for each particular receiver, and are shipped with it.

ACCESSORIES REQUIRED: Accessories required, but not supplied as a part of Model 802, to put the receiver into operation are as follows:

Antenna and ground -- antenna may be a single wire 20 to 70 ft. long, including leadin (or may be a suitable doublet), erected as high in the air and clear of surrounding objects as practicable. Ground may be a connection to a well-scrapped cold water pipe.

1 each 6BE6, 6BA6, 6AK6 tubes
2 -- 6J6 tubes
1 pair of 2,000 ohm headphones (if desired)
1 Power supply to provide 100/105 volts at 35 ma. d.c., 180 to 250 volts d.c. at 18 ma. and 6.3 volts a.c. or d.c. at 1.65 amperes. Power supply may be a well-filtered a.c. unit assembled from standard broadcast receiver replacement parts, a 6-volt storage battery and suitable Vibropack or dry B batteries, or entirely dry batteries in emergency.

INSTALLATION: Insert vacuum tubes in their sockets as indicated in Fig. 1. Make sure each is fully seated in its socket, and that shield body encloses 6BA6 i.f. amplifier. Erect suitable antenna and connect its leadin to one of two wires projecting from L1 socket thru hole in rear of cabinet. Connect ground lead to the second of these two wires and to BLACK wire (B-, A-). Connect power supply to twisted colored leads projecting from receiver cabinet, being careful to follow exactly color indications upon Fig. 2 for each wire. On-off switch upon REG. control is not wired into receiver circuit, but is brought out thru the two BLUE wires of power cable. It may be connected as desired to control the power supply, as in the 115 volt primary circuit of an a.c. power supply, etc.

Insert coils for desired amateur band in sockets. Coil marked "ANT" must go into upper left socket; coil marked "OSC" must go into center socket. Seat coils fully in sockets, not at an angle. Take care in inserting or removing coils NOT TO BEND THE COPPER VANES controlled by ANT. and TUNE knobs. Tuning range and relogging calibration will be shifted if vanes are bent, and unless coils are inserted in sockets exactly the same way each time they are changed. Coils can be most easily removed by inserting a knife-blade or screw-driver tip between socket and coil base, then prying coil form back sufficiently to free it for easy finger removal. BEFORE CHANGING COILS BE SURE ANT. AND TUNE KNOBS ARE SO TURNED THAT THEIR COPPER VANES ARE OUT OF THE WAY AND DO NOT IMPEDE COIL REMOVAL OR INSERTION.

OPERATION: With tubes and coils for desired band in place, power supply connected and power turned on, antenna and ground connected, proceed as follows: Set B.F.O. switch OFF, N.L. switch OFF, VOL. to 10. Advance REG. knob from 0 toward 10 until a rushing noise is heard from the speaker indicating that the i.f. amplifier is regenerating, possibly even oscillating. Turn REG. knob up just enough so stations may be tuned in on the main TUNE dial as a squeal. Set ANT. knob for greatest volume, retarding VOL. knob if volume is so great as to cause microphonic howling from speaker.

Greatest sensitivity — and selectivity — is with REG. knob set just below the point where signals are heard as squeals. KEEP IT BELOW THIS POINT OF OSCILLATION. While CW signals can be received with B.F.O. OFF by pushing REG. knob up to oscillating point of i.f. amplifier, this does not give best results. Use REG. knob to control sensitivity and selectivity -- always set it below point of i.f. oscillation, else when B.F.O. is turned ON more squeals and "birdies" will be heard than signals.

©John F. Rider

Having operated Model 802 for possibly half an hour to find out how it works and controls, (using oscillating i.f. as above in this initial test only to make CW signals audible, or to locate weak phone stations by their carrier squeals), set REG. about ½ division below point of oscillation and turn B.F.O. ON. Tune in CW signals as on any receiver; locate weak phone stations by tuning to their squeal, then turn B.F.O. OFF to make speech audible and clear. Note the extreme selectivity possible -- the muffling of speech quality as REG. knob is advanced toward i.f. oscillation. This is side-band cutting due to the extraordinary selectivity possible to a regenerative i.f. system.

It is this extreme sensitivity that gives Model 802 the advantages of "single-signal" CW telegraph reception -- which mutes one of the two audio beats found on each side of carrier resonance. B.F.O. may be set by adjustment of C5d, either to exact i.f. resonance for locating weak phone stations, or preferably about 1,000 cycles to one side of resonance for "single-signal" CW. When so set, if REG. knob is operated just below i.f. oscillation, one of the two audio beats associated with each CW signal will be muted almost to inaudibility -- giving crystal selectivity without the annoying "pinging" quality associated with crystal filters. To set B.F.O. for single-signal reception, tune in a weak phone station, or a telegraph station which can be heard as key-clicks or "thumps", with B.F.O. off and REG. set just below squeal point.

Turn ON B.F.O. and rotate rotor of C5d using the eraser on the end of a lead pencil to turn same, until the audible beat note is at about 1,000 cycles. Now tune thru the signal, and note that the second audio beat note is practically inaudible -- much weaker than the other. This condition can obtain for two settings of C5d; use the one with the rotor of C5d turned furthest in.

It is desirable to read the section of the A.R.R.L. Handbook describing operation of series-valve noise limiters to gain understanding thereof. The series-valve noise limiter of Model 802 Receiver (right hand triode of center 6J6, Fig. 2) may be thought of as a "gate", which may be opened, partially closed or fully closed by adjustment of P3. Full open, the gate passes both signals and noise; closed it will cut off both; partially closed it can cut out noise louder than a desired signal to improve signal readability.

To use the noise limiter, set NOISE switch S1 to ON after tuning in a weak signal markedly "down" in local noise interference. Slowly rotate P3 until signal volume is neither reduced nor signal quality distorted but noise is reduced to a point where it is no louder than signal. Advancing P3 further will reduce both noise and signal volume together. Operate with P3 set to reduce noise as much as possible without impairing signal. Adjust P3 for each signal received. Set NOISE switch S1 OFF in tuning for signals, switching noise limiter into circuit only when required. Leaving NOISE switch ON when tuning will result in distortion of signals louder than the one for which it was set.

MAINTENANCE: Model 802 is so basically simple that, outside of customary long-time tube deterioration, there is little to go wrong with it. Its relatively high 735 kc. i.f. frequency results in good image rejection without an r.f. stage. When operated near powerful local broadcast stations operating on 730 or 740 kc., interference therefrom may sometimes be experienced. This may be eliminated by tuning the i.f. amplifiers (adjust capacitors C5, C5a, C5b, C5c and C5d) to a new i.f. frequency just sufficiently away from 735 kc. to cut out such interference.

Care must be taken NOT TO BEND the copper tuning vanes actuated by ANT and TUNE knobs. Each affects the field of the coil (L1, L2) with which it is associated. If vanes are bent, or coils are not seated fully and identically in their sockets each time they are changed, logging of stations tuned in previously will not repeat exactly upon TUNE dial. Accidental bending of vanes can shift tuning range so it will no longer be as originally established. Should this occur, vanes may be repositioned by gently bending them to or away from coil ends. Do this ONLY if they are accidentally bent, and then to bring tuning back correctly upon ANT and TUNE scales for stations first at high, then at low, frequency ends of each coil tuning range.

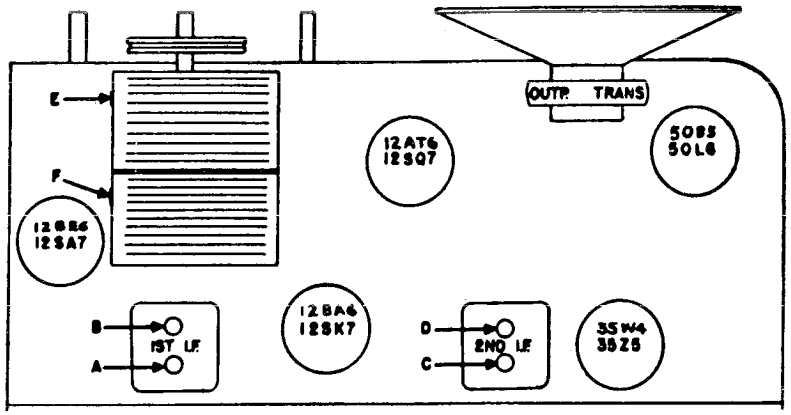
TECHNICAL INFORMATION FOR SERVICE

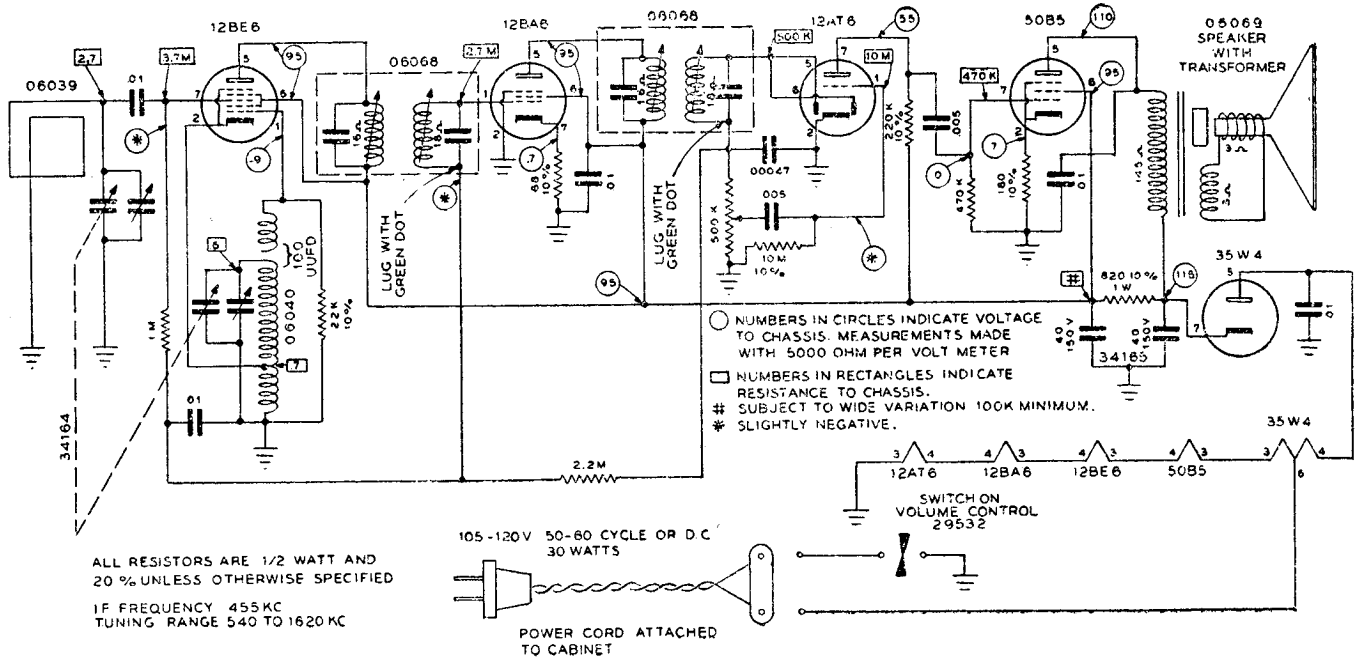
ALIGNMENT PROCEDURE

1. Connect a suitable signal generator to the R.F. section of the tuning condenser. Connect the ground side of the generator to the frame of the condenser. Use a .05 condenser to isolate the generator from the R.F. section.
2. Connect a suitable output meter to the voice coil leads of the speaker.
3. With the variable condenser open, apply a 455 Kc. signal. Use the lowest level consistent with good output indication.
4. Adjust trimmers A, B, C, and D for maximum response, reducing the input signal as required to keep the output meter on scale.
5. Connect the generator to terminals A & G through a 400 ohm dummy antenna. Apply a 1720 Kc. signal and adjust trimmer E to maximum.
6. Set the signal generator to 1400 Kc. Tune the receiver dial to maximum response, then adjust trimmer F to maximum response. This completes the alignment.

TUBE LOCATION CHART



©John F. Rider



Power Supply: 105-120 volts 50-60 cycles AC, or
105-120 volts DC.

DC Operation: When using DC supply if receiver does not operate, reverse the line cord plug in the power outlet.

Antenna: An unusually efficient built-in antenna is used in this receiver, making an outisde antenna unnecessary. For this reason no provision is made for connecting an outisde antenna.

Ground: Do not attempt to connect a ground to this receiver.

CAUTION: One side of the power line is connected to chassis in this receiver. Do not attempt to operate the receiver out of its cabinet.

MODELS 8C, 8CK, Rev.

MEISSNER FM RECEPTOR
MODEL 8C, 8CK Rev.

ANTENNAS

This receptor has been designed to use a 300 ohm antenna, either indoor or outdoor type.

The indoor antenna (Fig. 1) is for compact installation and is recommended only for local station receoption. Such an antenna may be purchased or may be built according to Figure 1. This indoor antenna is a folded dipole omnidirectional antenna intended for operation in a horizontal plane. The drawing shows the bottom view. Cut off a 5 foot length of 300 ohm transmission line and secure it to the mounting board, following dimensions shown in Figure 1. Measure 2" from each end of the transmission line and remove the dielectric material back to this point. Twist the bared wires together and solder. Locate the center point. Cut the outside strand of the two wire line. Remove the insulating material from the wires, leaving approximately 1/2" bare lead, to which the lead-in line is attached and soldered.

In some locations an indoor antenna is unsatisfactory, particularly in building having steel in their construction or in areas where large masses of metal are present. In the installation of an outdoor antenna, it should be remembered that radio waves of the frequencies used for FM transmission travel in straight lines, and for best reception, the antenna should be located above all obstructions which might block or alter the path of incoming signals. A high quality 300 ohm transmission line should be used to connect the antenna to the receptor. If low loss line is used, there will be no appreciable loss of signal in the line if the line itself is kept reasonably short and direct to the antenna.

An outdoor antenna may be purchased from your dealer or may be constructed as shown in Figure 2. This outdoor antenna is a 300 ohm folded dipole which will show some directional characteristic. Four conduit clamps are used to secure the 11/16" conduit to the support post. Each wire in the 300 ohm lead-in line is connected to an end of the antenna element. This may be done by carefully soldering each wire to the conduit and leaving a small amount of slack before securing the lead-in line to the support post.

AC OUTLET

The Meissner Model 8C FM receptor has a power outlet on the rear skirt of the chassis into which the associated power amplifier may be plugged. Power to this outlet is controlled by the 8C power switch and the associated amplifier may thus be switched "on" or "off" coincidental with the receptor.

CAUTION: Power drawn from this receptacle should not exceed 2.5 amperes at 115 volts.

CONNECTIONS TO AN AC RECEIVER

Although the receptor will operate with any radio receiver, large or small, that has terminals for a phonograph pickup, the audio quality inherent in the frequency modulation system will be more apparent when it is used with a regular type radio receiver having a large speaker and baffle as well as a good audio amplifier. The receptor may also be connected directly to power amplifiers which have high impedance inputs and which will give full output with 3 volts RMS input. The receptor should not be connected to a microphone input. The shielded rubber-covered lead from the receptor carries the audio output of the unit and is to be connected to the phonograph input terminals of the radio receiver or to the high impedance high level input of the power amplifier.

©John F. Rider

It is not recommended that the receptor be connected to an input designed for the new magnetic type pickups. These pickups have an output many times below that of the receptor and are fed into a preamplifier having a very high gain and usually some bass compensation which might not complement the receptor. Should the receptor be fed into such a preamplifier, the receptor output would need to be reduced to a very low level in order to prevent overloading and under this condition the hum and extraneous noises coming from the receptor and being picked up by the connecting cable might become objectionable.

The audio output of the receptor with maximum volume control setting is approximately 3 volts RMS with minimum usable signal input. For greater signal inputs, output voltages as high as 15 volts RMS may be obtained with negligible distortion. OUTPUT is high impedance and should be worked into a load of from 100,000 to 500,000 ohms. This data should be borne in mind when connecting the receptor to a radio receiver or power amplifier.

Various input arrangements will be encountered in radio receivers and amplifiers of different manufacture, such as jacks of various types, terminal strips and binding posts. Your dealer will be able to supply an appropriate plug to make connections to your receiver or amplifier. For instance, if the unit with which it is to be used is provided with a phonograph "jack", the corresponding type "plug" should be connected to the shielded lead, the outside metal shielding being connected to the frame or ground side of the plug and the inside insulated wire being connected to the high (tip) side of the plug. With the receptor placed conveniently close to the associated receiver or amplifier, the phonograph plug may be inserted and the receptor is ready for use. (See PHONO FEED THROUGH below.) When terminal strips or binding posts are used, the shielded lead from the receptor connects directly to these points without additional parts. In all cases, the outside shielding connects to the terminal which connects directly (or through a coupling capacitor) to the chassis.

If the receiver has no "Phone" or "Television Sound" terminals, the additional switch and terminals can be installed by any competent radio service man.

CONNECTIONS TO AN AC-DC RECEIVER

This receptor is not recommended for use with AC-DC receivers or amplifiers of the "hot chassis" type because of the shock and fire hazards involved. It may, however, be used with AC-DC receivers or amplifiers of the type in which the power line is isolated from the chassis. Connection to such a receiver or amplifier should be made only with the approval of a competent service man. In using the receptor with such a receiver or amplifier, the line cord plug should be reversed in the power outlet to find the position which causes least hum. In some instances it may be found that operation from power lines which are not properly grounded will not be satisfactory.

PHONO FEED THROUGH

To eliminate the necessity of installing additional switches or the bother of disconnecting the receptor when it is desired to use the phonograph, the Meissner Model 8C FM Receptor now has a phono feed-through switch. A standard phono input jack will be found on the rear skirt of the receptor chassis and the phonograph may be plugged directly into this jack. A single pole double throw switch with click filter is actuated by a cam on the shaft of the combination volume on-off switch of the receptor. When the receptor is turned 'off' the switch is so thrown that the phono output simply goes through the receptor and comes out the audio out-

©John F. Rider

put cable of the receptor which is connected to the receiver or amplifier. When the receptor is turned 'on' the phono output is disconnected and normal operation of the receptor is obtained.

No attempt should be made to feed the output of the new magnetic pickups through the receptor. The additional length of shielded cable and the unshielded switch contacts and connecting wires may result in excessive hum and extraneous noises. Furthermore, it was pointed out that the receptor should not be operated into a preamplifier of the type used in conjunction with these magnetic pickups.

OPERATING THE RECEPTOR

Turn the left hand control knob clockwise until the click is heard and the dial scale is illuminated. The radio receiver or amplifier to which the receptor is connected must also be turned on and its selector switch set to the appropriate position, that is, to "Phonograph" in case the receptor is connected to the phono input. Allow period of about 30 seconds warm-up time. Now with the receptor volume control turned counter-clockwise, advance the volume control of the receiver or amplifier until the hum level is objectionable; then back up the control until the hum level reaches an acceptable level. This is the correct operating point for the receiver or amplifier volume control and it should be returned to approximately this setting whenever the receptor is used. If the above procedure is not used for determining the correct setting of the receiver or amplifier volume control, then unsatisfactory reception may be the result due to the overload and distortion in the receptor. Stations are selected by the right hand or tuning knob. Proper tuning will be accomplished when maximum volume level and maximum noise reduction have been attained. Although these points are very nearly coincident, tuning should always be accomplished by tuning for the "no noise" point after the maximum volume point has been located.

It is characteristic of FM receptors using the "ratio detector" system to show three points of tuning, located very close together on the dial, for each station. Only the center point of these three points will give best noise reduction, and this is the one that should always be chosen.

ALIGNMENT

The equipment required for proper alignment of this receptor is an unmodulated RF signal generator which will cover 10.7 megacycles and a range of 88 to 108 megacycles, and a DC voltmeter having a low range of 1 to 5 volts DC.

Connect the positive lead of the DC voltmeter to pin #5 of the 6AL5 detector tube, and the negative lead to pin #7 of the 6AL5. Apply an unmodulated 10.7 megacycle signal to the grid of the second 6BA6 IF amplifier tube, through an .05 microfarad coupling condenser. Tune the bottom adjustment screw of the detector coil for maximum indication on the DC voltmeter. This completes this part of the adjustment.

Next, locate the 220 ohm resistor which is connected to the center lug of three lugs of the detector coil (on the side next to the 6AL5 socket). Connect the negative lead of the DC voltmeter to the junction of this 220 ohm resistor and the lug on the support post. Connect the positive lead of the voltmeter to the receptor chassis. With the 10.7 megacycle signal still applied to the grid of the second 6BA6, tune the top adjustment screw of the detector coil for a point of zero voltage. If more than a half turn adjustment was necessary in either of the preceding steps, then both of the adjustments should be repeated.

I F ALIGNMENT

Without changing the signal generator frequency, introduce the 10.7

©John F. Rider

megacycle signal at a relatively high level into the antenna terminals. Connect the DC voltmeter between pins #5 and #7 of the 6AL5 detector tube. Rotate the tuning knob slightly to determine that the receptor is not receiving a harmonic of the signal generator, and is receiving the 10.7 megacycle signal. Adjust both top and bottom screws of the two IF transformers for maximum DC indication on the meter, keeping the signal level from the generator low enough so that this DC voltage does not exceed 5 volts.

R F ALIGNMENT

The RF section contains a double converter system in which the oscillator operates at one half signal frequency, minus 5.35 megacycles. The image frequency is so far away from the signal frequency that it is normally not necessary to locate or pay any particular attention to the image during the alignment procedure. The DC voltmeter should be connected to pins #5 and #7 of the 6AL5 as it was during the alignment of the IF. Since the chassis must be removed from the cabinet and away from the dial scale for any alignment work, index points have been stamped on the dial backing plate to facilitate alignment. Rotate the tuning knob until the gang condenser is in the fully meshed position. and index the pointer with the calibration marker line farthest from the dial drum. Now rotate the gang condenser until the pointer is indexed with the marker line nearest the dial drum. The receptor should now be tuned to 108 megacycles. If the signal generator indicates that it is not tuned to 108 megacycles, rotate the oscillator trimmer (nearest the dial drum) a small amount until the signal is tuned in with the maximum voltage indication on the meter. The receptor is now properly calibrated to the dial markers and the antenna trimmer (farthest from the dial drum) and the converter trimmer (center) should be adjusted for maximum voltage indication on the DC voltmeter. The converter trimmer has a slight effect on the oscillator circuit and the tuning knob should be rocked back and forth slightly during the alignment of the converter trimmer in order to locate the point of maximum output. This completes the alignment of the receptor. The sensitivity should be checked over the band and normally should not vary more than approximately 6 db.

SERVICE DATA

Power consumption - 35 watts (at normal Line)
Intermediate Frequency - 10.7 megacycles
Tuning range - 88 to 108 megacycles

Voltage Chart - The voltages tabulated in the table below are the correct voltages which should be measured between the socket terminal and chassis with nominal line voltage and no signal. All voltages measured with a high impedance voltmeter. Allowance should be made for loading if a low impedance voltmeter is used for checking.
*Electronic type meters may indicate a slightly negative voltage at this terminal.

MEISSNER AM-FM RADIO-PHONOGRAPH
MODEL 16A

Installation-Operation Instructions

Specifications

Power Supply: 105-120 volts, 50-60 cycles.
CAUTION: DO NOT ATTEMPT TO OPERATE ON OTHER SUPPLY.
Power Consumption: 130 watts.
Type of Circuit: Superheterodyne.
Intermediate Frequencies: AM 455 kc.
FM 10.7 mc.
Pointer Travel: 9".
Tuning Knob Ratio: 18:1.
Antenna Impedance: Broadcast - Standard
F M - 300 ohms

Nominal Performance

Sensitivity: 5 microvolts AM.
Approximately 10 microvolts for 30 db quieting on FM.
Audio Fidelity: Flat within ±2 db from 100 to 10,000 cycles, tone controls clockwise.
Band Width at 1000 kc - 7 kc at 2X down.
Output: 8 watts at 5% distortion.
Tone Control Action:
Bass boost at 40 cycles plus 18 db.
Treble suppression at 8,000 cycles - 13 db.
Hum: 58 db below full output, full bass boost (on phono).

Antenna - Ground

There is a 5 terminal strip near the back of the chassis for connection to the FM antenna, AM antenna, and ground. the FM antenna may be indoors or outdoors, preferably of the folded dipole type. The two left-hand terminals marked FM are for connection of the twin lead 300 ohm transmission line from the FM antenna.

A separate AM antenna may be used by connecting to the AM antenna terminal at the right, or the FM antenna and transmission line may be used as the AM antenna. This is done by connecting a jumper wire between terminal X and the AM antenna terminal.

A heavy ground connection, as short as possible, should be connected to the ground terminal at the center. Cold water pipes or a galvanized rod driven several feet into the ground make good grounds, but the use of hot water, steam pipes, or metal conduit should be avoided. The use of a good ground connection will do much to minimize the pickup of electrical interference carried into the tuner by way of the power line.

Tone Controls

Bass: 18 db control at 40 cycles, 12 db at 100 cycles.
Treble: 10 db control at 6000 cycles, 15 db at 10,000 cycles.

©John F. Rider

MODEL 16A

AM Alignment

I F Alignment

Set selector switch on receiver to AM. Set tuning dial to 1600 kc.
Set signal generator to 455 kc with 30% modulation at 400 c.p.s.
Connect high side of signal generator to pin 7 of 6BE6 through 0.1 mfd. condenser, low side to chassis. Connect output meter to high side of volume control and chassis.
Using as low output from signal generator as possible, adjust top and bottom cores of the three AM I F transformers for maximum output.

R F Alignment

Fully mesh gang condenser and adjust pointer position to match scratch mark at left on dial backing plate.
Set receiver and signal generator to 1400 kc.
Move high side of signal generator to antenna terminal through 200 μμfd. condenser. Adjust antenna and R F trimmers for maximum output.
Adjust oscillator trimmer at top of large front gang section for maximum output. Adjust R F trimmer at top of large middle gang section for maximum output.

FM Alignment

I F Alignment, using FM signal generator and oscilloscope.

Set selector switch on receiver to FM.
Connect high side of FM signal generator through .01 mfd. condenser to pin 1 of 6BA6 2nd I F amplifier. Connect low side to chassis. Connect vertical input of oscilloscope to point A, the ground to chassis. Connect horizontal input of oscilloscope to "Sync" terminal, the ground to ground terminal of signal generator, using a phasing control to compensate for phase shift.
Set deviation to 200 kc at 400 c.p.s. modulation on 10.7 mc. Set output to approximately 0.1 volt. Set horizontal sweep selector of oscilloscope to horizontal amplifier. Adjust both cores of ratio detector coil, bottom slug for maximum amplitude and top slug for symmetrical pattern with a linear center portion.
Move high side of signal generator to pin 1 of 6BA6 1st I F amplifier, using same dummy. Set deviation to 150 kc. Adjust both cores of 2nd I F transformer for maximum amplitude and symmetry of pattern.
Move high side of signal generator to pin 2 of 12AT7 converter tube, using same dummy. Adjust both cores of 1st I F transformer for maximum amplitude and symmetry of pattern.
With same signal generator connection, check adjustment of cores of 2nd I F transformer. Ordinarily, readjustment of the ratio detector cores is unnecessary. If the pattern is not symmetrical with a linear center portion, the entire alignment procedure must be repeated.

I F Alignment, using AM signal generator and V T V M.

Set selector switch on receiver to FM.
Connect high side of signal generator to pin 1 of 6BA6 2nd IF amplifier through .01 mfd. condenser. Connect low side to chassis. Set generator to 10.7 mc. with no modulation and set output to about 0.1 volt. Connect d.c. probe of VTVM to pin 7 of 6AL5 ratio detector and connect common to chassis. Adjust bottom core of ratio detector coil for maximum negative reading.
Connect d.c. probe to point "A" and adjust top core for zero reading. Repeat these two steps.
Connect d.c. probe to pin 7 of 6AL5. Connect high side of signal generator to pin 1 of 6BA6 1st IF amplifier, using same dummy. Adjust top and bottom cores of 2nd IF transformer for maximum negative reading.

©John F. Rider

Connect signal generator to pin 2 of 12AT7 converter, using same dummy. Adjust top and bottom cores of 1st IF transformer for maximum negative reading.

With same signal generator connections, re-check core adjustments of 2nd IF transformer for maximum negative reading.

Connect d.c. probe to point "A" and re-check for zero reading. Little or no further adjustment of the top core of the ratio detector coil should be necessary. If the reading is much off from zero, the entire alignment procedure should be repeated.

R F Alignment

Set selector switch on receiver to FM.

Connect high side of FM signal generator through .01 mfd. condenser to pin 2 of 12AT7 converter. Connect low side to chassis.

Set signal generator and receiver to 108 mc. Set deviation to 75 mc at 400 c.p.s. modulation.

Connect output meter to point "A" and chassis.

Carefully adjust oscillator trimmer, at top of small front gang section, for maximum output, starting at minimum trimmer capacity and selecting the first response reached. Use as low output from signal generator as is practical.

Set signal generator and receiver to 88 mc. Squeeze or spread oscillator coil to obtain maximum output.

Repeat the above two steps until no further improvement results.

Connect high side of signal generator to pin 1 of 6AG5 RF amplifier, using same dummy. Set signal generator and receiver to 108 mc. Adjust RF trimmer at top of small center gang section, for maximum output, rocking tuning dial slightly to compensate for oscillator pulling. Reset oscillator trimmer to match pointer to 108 mc. dial scale mark.

Set signal generator and receiver to 88 mc. Squeeze or spread RF coil to obtain maximum output, rocking tuning dial. Repeat RF trimmer adjustment at 108 mc. and coil adjustment at 88 mc. until no further improvement results, resetting oscillator trimmer if necessary.

Connect terminals of signal generator to antenna terminals, using a 150 ohm carbon (non-inductive) resistor in series with each terminal.

Set signal generator and receiver to 108 mc. Adjust antenna trimmer, at top of small rear gang section for maximum output.

Set signal generator and receiver to 88 mc. Squeeze or spread antenna coil secondary for maximum output. Repeat last two steps until no further improvement results.

Operation

AM reception is obtained by turning the selector switch counter-clockwise to the AM position. The tuning knob is rotated to select stations. Proper tuning is indicated by maximum closing of the tuning eye.

FM reception is obtained by turning the selector switch to the FM position. Tuning is accomplished as for AM, normally, three points of reception close together will be observed on FM stations. The correct point for reception is the center one, as indicated by the tuning eye.

Phonograph operation is obtained by turning the selector switch clockwise to the phono position and operating the automatic record-changer according to instructions.

Bass boost is obtained by rotating the bass control counterclockwise. Treble suppression is obtained by rotating the treble control counter-clockwise.

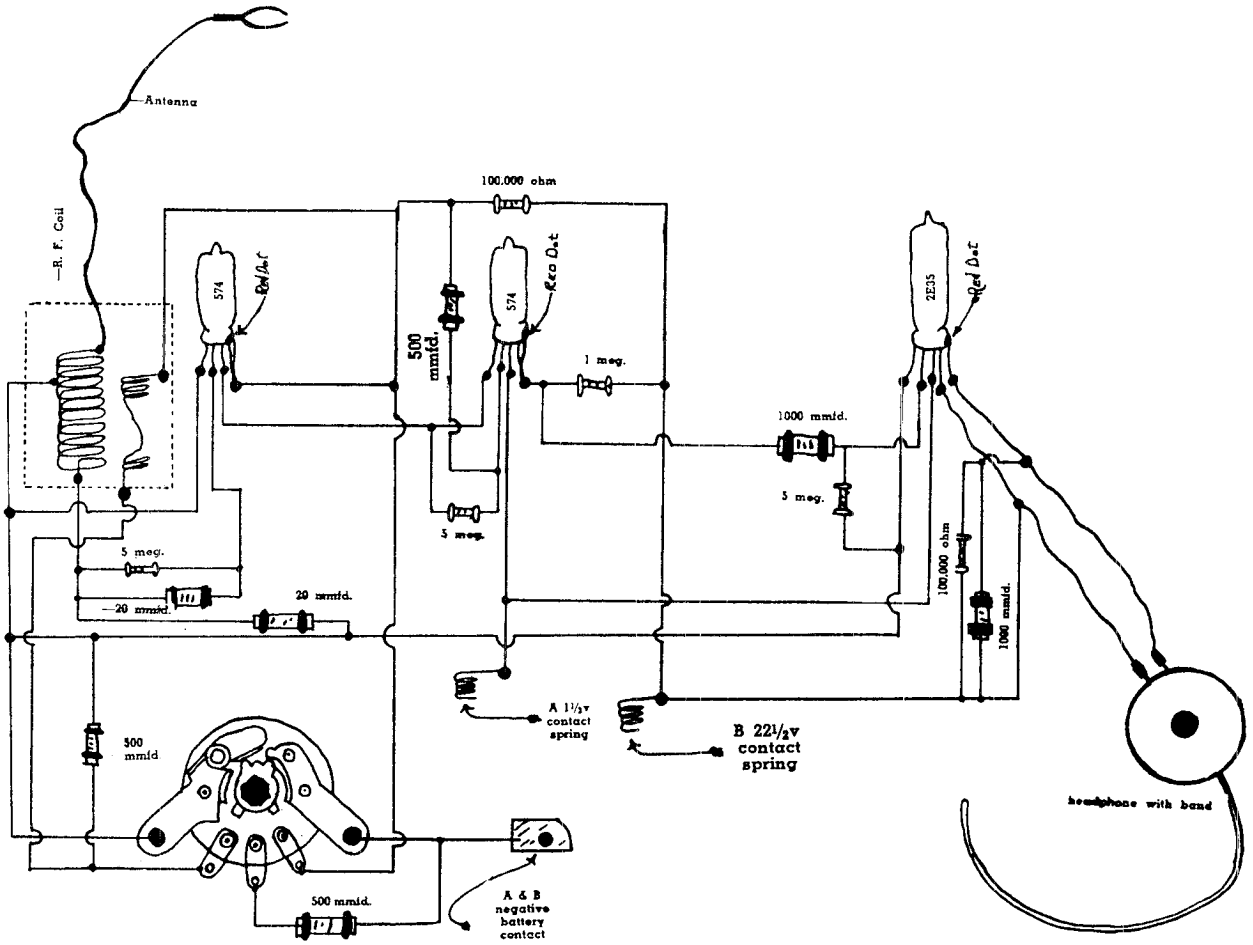
MODEL Micro
Pocket Radio



Your Micro Radio kit contains all the necessary parts for building the complete set.

You will also need solder, soldering iron, and a screw driver.

The pictorial schematic diagram and photographs of both sides of the chassis show correct plocement of parts.

To construct your set—

1. Solder in wires that compose the circuit.
2. Install condensers.
3. Install resistors.
4. Install tubes—IMPORTANT! The plate lead on these tubes are color coded with a red dot on the side of the glass tube envelope. This will be referred to as No. 5 lead. The leads of each tube are:
   - No. 5—Plate.
   - No. 4—Screen .
   - No. 3—Filament positive.
   - No. 2—Control grid.
   - No. 1—Filament negative.
5. Attach RF coil to the chassis as shown in photo.
   This coil must be attached in such a manner that it misses the large screw hole on the bottom of the chassis, to allow the radio to be cased without damage to the coil.
6. Solder the headphone leads to the screen and plate of the output tube.
7. Attach the two contact springs for battery positive contacts.
8. Solder in antenna.
10. Attach clip to the other end of antenna wire.

The instrument is now ready to be tested. Place the chassis in the bottom half of the case, and insert the four self-tapping screws through the case and the chassis. This will allow the chassis to be held firmly in place, and thus enable you to insert the batteries to make contact with the negative and positive contacts.

Attach the metal clip on the antenna to an aerial connection—such as the metal portion of a

©John F. Rider

MODEL Micro
Pocket Radio

telephone, lamp, outside antenna, or similar object. Now insert the batteries, making certain that the metal plate on the bottom of the case slide touches the bottom of both batteries, and the small metal plate on the chassis below coil. Now put the iron core (slug) halfway in the RF coil. It is wise to attach the small plastic button temporarily on the bent screw in the iron core for easier tuning.

Turn the switch on, and slide the slug slowly back and forth in the coil until you hear a whistle, which is the signal of a radio station. (If this whistle is not heard, you probably have the connections to the tickler winding reversed).

After you hear the whistle, back the volume control down until the whistle disappears, then retune by moving the iron core back and forth just a trifle until the station is properly tuned in.

If your radio brings in stations, it is now ready to be cased. Remove the batteries, then place the spring over the bent brass screw of the slug, and the brass washer on top of this spring. Now put the top half of the case in place, in such a manner that hte end of the brass screw in the slug will come through the slot provided for tuning.

Tighten the four screws in the case. Cut off the brass screw so that it does not extend beyond the outside of the case more than 1/16". Screw the plastic tuning knob to the threaded portion of the brass screw.

After this is done, place the batteries back in the instrument in the proper manner, making sure that the metal portion of the bottom of the slide makes contact with the bottom of the A battery, the bottom of the B battery, and the metal plate—and your Micro Radio is complete.

SPECIFICATIONS

Power Requirement: 120 volts, 50 to 60 cycles, 110 watts.

Frequency Coverage:

AM Band—540 to 1600 KC
FM Band—88 to 108 MC

Audio Sensitivity: .05 volts for ½ watt output.

Maximum Undistorted Audio: 10 watts.

AM Sensitivity: 2 to 4 microvolts.

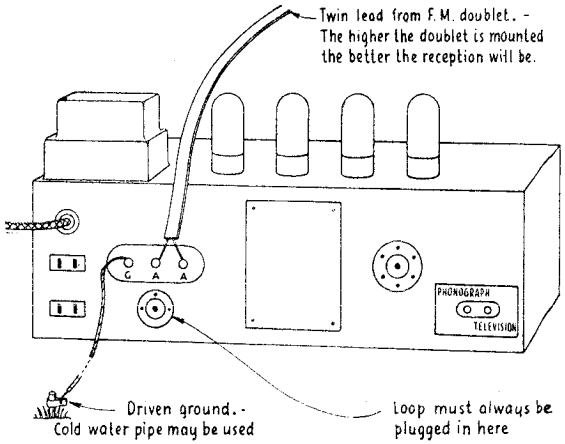
FM Sensitivity: 100 microvolts, quieting signal.
10 microvolts, minimum signal.

Tube Complement:

RF	6BA6	FM Detector	6AL5
Mixer	6BA7	1st AF & AM Det.	6AV6
Oscillator & AFC	12AT7	Phase Inv.	6C4
1st IF	6BA6	AF output	6V6GT
2nd IF	6BA6	AF output	6V6GT
3rd IF, FM	6BA6	Rectifier	5Y3GT

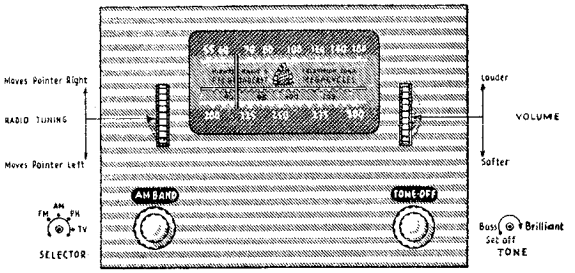
INSTALLATION

The Midwest Radio & Television receivers have built-in antennae for satisfactory reception of signals on the broadcast band, short wave and FM bands where the location is not unfavorable. In homes or apartments where steel is used extensively, such as for beams and concrete reinforcements or lath, or in rural areas distant from the broadcasting stations an FM doublet must be installed. The straight doublet antenna is directional only on the FM broadcast band so that it need be oriented only with respect to the FM transmitter location. The Midwest Model **DP** di-pole is a special design which is not directional and we recommend it for use with Midwest receivers for FM, broadcast and short wave reception.



Twin lead from F.M. doublet. - The higher the doublet is mounted the better the reception will be.
G A A
PHONOGRAPH
TELEVISION
Driven ground. - Cold water pipe may be used
Loop must always be plugged in here

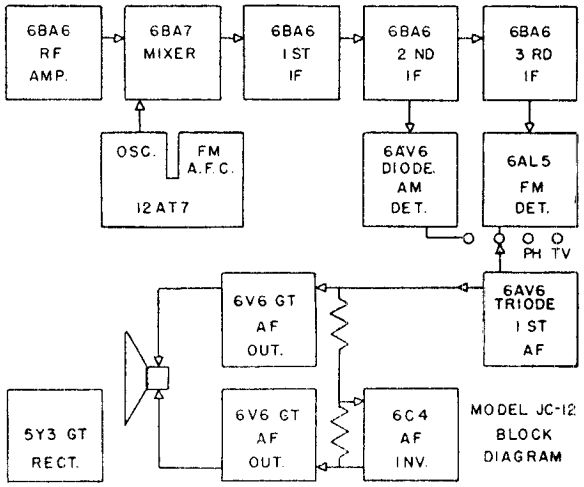
PRECAUTIONS. Be sure that the speaker and Magna Tenna Loop are plugged in; also the flexible dipole leads must be connected to screw strip at "A–A". A ground wire may be connected to "G" but it is usually not needed.



MODELS C-12, RC-12, SK-12; Ch. JC-12

Noise and interference is usually due to causes external to the receiver and requires diagnosis and correction by the local service technician.

Trouble may be diagnosed for this receiver as a standard superheterodyne. The block diagram is printed here.



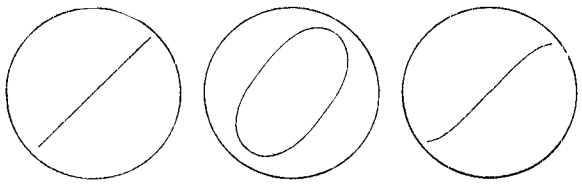
ALIGNMENT

The alignment points are shown on the top and bottom views of the chassis as well as certain parts numbers.

AM IF should be aligned at 456 KC. There are three transformers and six adjustments; the transformers are coupled with less than critical coupling and there is only one peak. Couple the generator into the mixer grid and use either AVC or audio for the output meter.

FM IF should be aligned at 10.7 MC. There are four transformers and eight adjustments; the transformers are over-coupled and must be aligned with a scope and sweep generator.

1. Connect generator to 3rd IF grid and vertical output of scope to the audio of the receiver at any point where sufficient signal is available and phasing can be properly adjusted.
2. Adjust the top screw for greatest length of straight line. This is the secondary winding; the bottom screw should give improvement in signal level.



A B C

A does not have the hook indicating that the sweep generator has a greater deviation than the detector capability.

B shows improper phasing of the horizontal sweep with the audio output of the receiver.

C is preferred because it shows the limits of deviation and you obtain it simply by adjusting the deviation (sweep width) control on the signal generator. Approximately 150 KC is normal.

3. Connect generator to 2nd IF gird and adjust the 2nd IF slugs for maximum signal **and** band width. This you can be sure of by the amount of hook at the ends of the line on the scope. Repeat this procedure for 1st IF grid and mixer grid. Adjust for greatest signal without appreciable loss of band width.

Alternate Method: The IF response of the 1st, 2nd and 3rd transformer may be observed more directly if you use a crystal detector at the plate of the 3rd IF tube and feed the vertical plates of the scope from that point. Use a CW marker at 10.7 to be sure the double peaked response curve straddles the ratio detector response. Observe each stage separately.

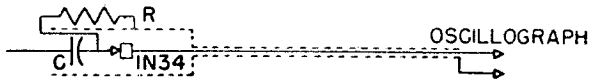
Notice: Do not use AM or CM signal to peak the FM transformers. Regeneration may result and bandwidth and noise rejector will be poor, although signal strength will increase.

FM RF should be trimmed at 105 MC. There should not be any reason to adjust the low end but if this is necessary it can be done by distorting the FM coils on the tuning gang.

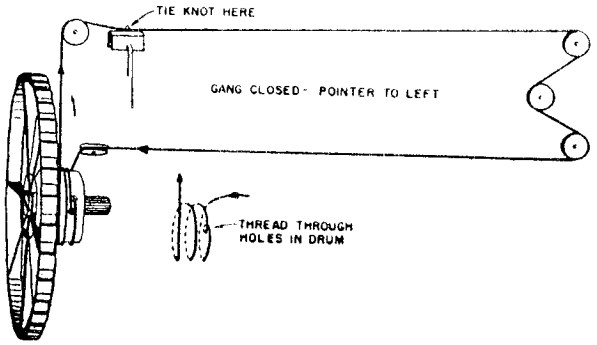
AM RF should be peaked at the high end with the trimmer and at the low end by core adjustment.

Notice: Use as low signal input as possible for readable output indication. Feed signal in from FM RF generator through 150 ohms in each lead to "A-A." Use 400 ohms in lead from AM RF generator and connect to either "A" terminal.

A very convenient design is shown here schematically of a Crystal probe for detection of resonant response for display on the oscillograph and your available materials will decide the physical design, most important feature is the ability to change the load resistor, R.



The value for C is limited by the physical size, any capacity greater than 100 mmfd will be satisfactory, the value of R should be 470 ohms when the probe is used in the IF stages to obtain the response of the grid circuit without effects from the tuned plate circuit whereas a value of 470K ohms is alright for general use,



For dial stringing use a light weight dial cord such as Bevin-Wilcox 6-18 Imperial silk cord.

Radio Band	Coil Adj.	Trimmer Adj.
AM	560 KC	1500 KC
FM	.....	105 MC

If replacement parts of identical manufacture and rating are not available for service repairs these should be ordered from Midwest Radio & Television Corporation, giving model number and serial number of the chassis and name of the part.

Repair data for the record changer mechanism is available separately, please specify Model.

The dial calibration for the Band Standard Broadcast, is from 55 to 160; if you add a zero to these numbers they will represent kilocycles. For example 700 kilocycles, WLW, appears on the dial as 70.

Your FM Broadcast band is calibrated in channel numbers; these channel numbers were assigned by the Federal Communications Commission for the convenience of the general public. However, in many parts o fthe country FM stations use a frequency designation so that we repeat the calibration in megacycles on the foil dial.

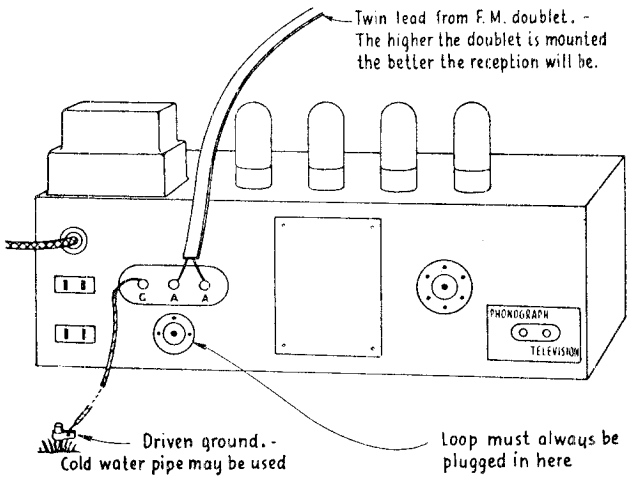
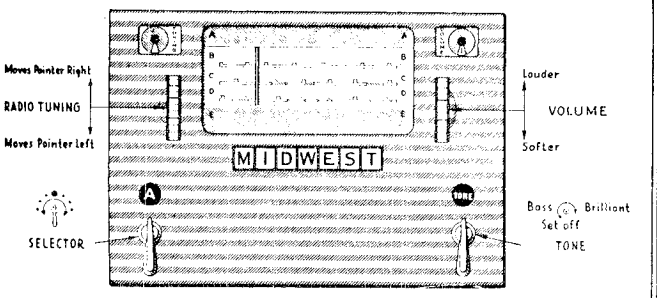
INSTALLATION

The Midwest Radio & Television receivers have built-in antennae for satisfactory reception of signals on the broadcast band, short wave and FM bands where the location is not unfavorable. In homes or apartments where steel is used extensively, such as for beams and concrete reinforcements or lath, or in rural areas distant from the broadcasting stations an FM doublet must be installed. The straight doublet antenna is directional only on the FM broadcast band so that it need be oriented only with respect to the FM transmitter location. The Midwest Model **DP** di-pole is a special design which is not directional and we recommend it for use with Midwest receivers for FM, broadcast and short wave reception.



Twin lead from F. M. doublet. - The higher the doublet is mounted the better the reception will be.
C A A
PHONOGRAPH
TELEVISION
Driven ground. - Cold water pipe may be used
Loop must always be plugged in here

PRECAUTIONS. Be sure that the speaker and Magna Tenna Loop are plugged in; also the flexible dipole leads must be connected to screw strip at "A–A". A ground wire may be connected to "G" but it is usually not needed.



The controls are two wheels whose rims extend through the panel on either side of the dial, and two chrome levers.

Operation is actually simple as ABC if you follow the steps as outlined here.

A. To turn set **ON** rotate the **TONE** lever to the right. Adjust for most pleasing tone after your program is tuned in.

B. Turn **SELECTOR** lever so that desired Radio Band, Phonograph or Television adapter is indicated in the round window above this lever. Note that A is the Standard Broadcast Band.

C. Tune to the desired station by rotating the **TUNING WHEEL** up or down to move the pointer across the dial. For your convenience a **TUNING INDICATOR** is placed above the Tuning Wheel. It may not close entirely or may flicker on noise; the minimum dark area is the point of correct tuning.

D. To increase volume rotate the **VOLUME WHEEL** up. To decrease volume rotate wheel downwards. The **VOLUME INDICATOR** shows a number from 1 to 8 and by noting the number you can set the volume before the set warms up and thus avoid too much or too little volume.

These same steps are described here in greater detail, with suggestions and further information about the use of the controls. Your Midwest receiver provides radio reception, phonograph reproduction and a television adapter position. Radio reception includes the standard American Broadcast band (AM), the FM Broadcast band and three short wave bands where you may receive Amateur, Police, and Commercial stations plus broadcasts on seven International Broadcast bands. These seven International Broadcast bands are indicated in red on the dial.

The automatic record changer will play automatically all records, all speeds and all sizes. After the stack of records is played the changer automatically shuts off. To turn the receiver **ON** rotate the **TONE** control lever clockwise. The **OFF-ON** switch is operated by the first few degrees of rotation of the **TONE** control, after which it serves to change the tone, reducing bass and boosting highs as it is rotated clockwise. Since the best fidelity is obtained when this control is at the intermediate position it is best to leave it in this position until all adjustments are completed. After which it may be returned to the setting most pleasing to you. This will depend somewhat upon the kind of program being received.

© John F. Rider

The next step to select the type of entertainment you wish is to turn the **SELECTOR** lever. The lever has seven positions where the following letters appear in the round window directly above it: **TV, FH, A, B, C, D** and **E**. The letters represent television adaptor, phonograph, and radio bands A–Standard American Broadcast, BCD–short wave bands and E–FM Broadcast.

Having selected one of the radio bands, preferably the American Broadcast band A for first trial, roll the **VOLUME** control wheel up to increase volume until some sound or signal is heard. The position of the volume control is indicated by the numeral in the window above this control.

To tune to any station roll the radio **TUNING** control wheel up or down; upwards motion moves the dial pointer to the right and downwards rotation of the **TUNING** drum moves the pointer to the left.

The dial calibration for the A band, Standard Broadcast, is from 55 to 160; if you add a zero to these numbers they will represent kilocycles. For example 700 kilocycles, WLW, appears on the dial as 70.

Above the tuning control is a rectangular window for the tuning indicator. This feature has been added to assist you in correctly tuning in the station; unless the station is properly "tuned-in" distortion, noise, low volume and poor tone will result. As you tune into a station you will notice that the dark segment closes, as you pass the station the dark segment begins to open again. Proper tuning is indicated when the segment is smallest. You will notice that the indicator will close tighter on the stronger stations or will flicker shut on noise; it is not the amount of closing but the point of minimum dark area that indicates correct tuning for that particular station. Strong stations may cause the tuning indicator to not only close but perhaps even overlap; the correct tuning is then the point of maximum overlap.

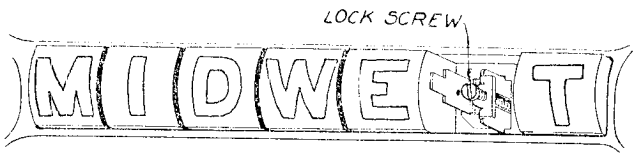
The tuning indicator is connected on the FM and Television bands but is not as reliable as on the Standard Broadcast and short wave bands. Many FM and Television signals of acceptable strength will not cause the indicator to close. Stronger signals may produce two points where the tuning indicator begins to close and in this case you should tune between these points; this is quite accurate.

The short wave bands cover completely all frequencies above the Broadcast band to 22 megacycles in three bands. These are all calibrated in megacycles. Amateur, Police and Commercial transmissions will be heard on band B. This type of transmission is usually on intermittently and you may spend considerable time locating stations. Bands C and D provide reception in seven International Broadcast Frequency Bands in addition to government, amateur and commercial stations.

The International Frequency bands are indicated on the dial by solid red areas in the calibration base line; as suggested on the dial, band C will be most active at night and band D most active by day. Because of the great distances involved and effects of weather and solar radiation on high frequency transmissions the reception on these bands is not always uniform but will vary greatly. Foreign reception may be excellent on one International Band and non-existant on another, this condition will change from one hour to the next and also with the time of year.

Your FM Broadcast band is marked E and is calibrated in channel numbers; these channel numbers were assigned by the Federal Communications Commission for the convenience of the general public. However in many parts of the country FM stations use a frequency designation so that we reprint at the end of this Manual a conversion chart to show the relation between channel number and frequency in megacycles.

The push buttons are for your convenience in selecting stations without the bother of making the exact tuning adjustments necessary for best reception. There are seven buttons and each button may be set for a station at any point on the dial. We do not recommend the use of the push buttons for short wave stations. To set the push buttons this exact procedure should be followed. A screwdriver will be needed.



1. Turn on the receiver and allow ten minutes to warm up; more time is desirable.
2. Remove the push button by pulling straight out. A hooked instrument will be of assistance.
3. Loosen the **LOCK SCREW** at least one half turn.
4. Using the screwdriver with the blade in the screw slot, push the mechanism in firmly. Hold in during step 5. The mechanism may bind at first and you must use sufficient force to break it loose so that the push buttom and **TUNING** control wheel are independent, that is, the **TUNING** control does not try to push the button mechanism outward when the pointer is tuned across the dial.
5. Tune the pointer past the desired station, then back to the desired station and make the tuning adjustment as carefully as you know how.
6. Tighten the **LOCK SCREW.**
7. Check the setting of this push button by tuning away from the station manually then push the button down firmly maintaining pressure until the pointer moves to the position it had when the **LOCK SCREW** was tightened. If the station is not tuned in perfectly repeat steps 2 to 6 carefully.
8. Adjust each of the seven buttons, or as many as you need, exactly as outlined above.

Any button can be set for any pointer position, however, you will find it more desirable to select the button nearest the pointer position so that each button may be more easily identified with the station. For example, the "M" button will be set for a station at the left of the dial, the "W" button will be set for a station near the center, etc.

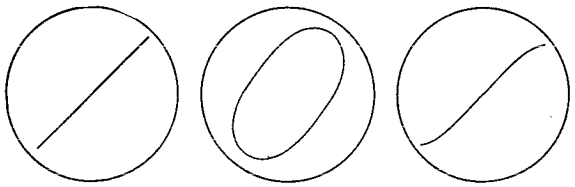
ALIGNMENT

The alignment points are shown on the top and bottom views of the chassis as well as certain parts numbers.

AM IF should be aligned at 456 KC. There are three transformers and six adjustments, the transformers are coupled with less than critical coupling and there is only one peak. Couple the generator into the mixer grid and use either AVC or audio for the output meter.

FM IF should be aligned at 10.7 MC. There are four transformers and eight adjustments, the transformers are over-coupled and must be aligned with a scope and sweep generator.

1. Connect generator to 3rd IF grid and vertical output of scope to the audio of the receiver at any point where sufficient signal is available and phasing can be properly adjusted.
2. Adjust the top screw for greatest length of straight line. This is the secondary winding, the bottom screw should give improvement in signal level.



A does not have the hook indicating that the sweep generator has a greater deviation than the detector capability.

B shows improper phasing of the horizontal sweep with the audio output of the receiver.

C is preferred because it shows the limits of deviation and you obtain it simply by adjusting the deviation (sweep width) control on the signal generator. Approximately 150 KC is normal.

3. Connect generator to 2nd IF gird and adjust the 2nd IF slugs for maximum signal **and** band width. This you can be sure of by the amount of hook at the ends of the line on the scope. Repeat this procedure for 1st IF grid and mixer grid. Adjust for greatest signal without appreciable loss of band width.

Alternate Method: The IF response of the 1st, 2nd and 3rd transformer may be observed more directly if you use a crystal detector at the plate of the 3rd IF tube and feed the vertical plates of the scope from that point. Use a CW marker at 10.7 to be sure the double peaked response curve straddles the ratio detector response. Observe each stage separately.

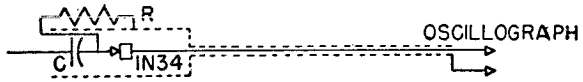
Notice: Do not use AM or CM signal to peak the FM transformers. Regeneration may result and bandwidth and noise rejector will be poor, although signal strength will increase.

FM RF should be trimmed at 105 MC. There should not be any reason to adjust the low end but if this is necessary it can be done by distorting the FM coils on the tuning gang.

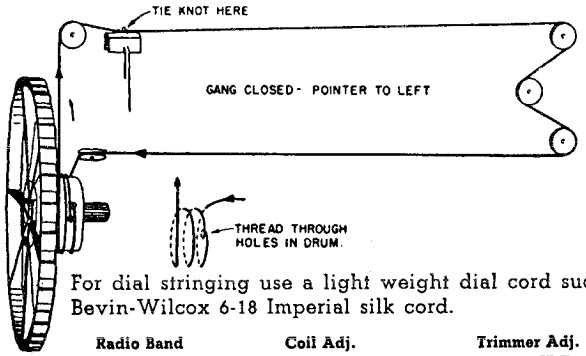
AM RF should be peaked at the high end with the trimmer and at the low end by core adjustment.

Notice: Use as low signal input as possible for readable output indication. Feed signal in from FM RF generator through 150 ohms in each lead to "A-A." Use 400 ohms in lead from AM RF generator and connect to either "A" terminal.

A very convenient design is shown here schematically of a Crystal probe for detection of resonant response for display on the oscillograph and your available materials will decide the physical design, most important feature is the ability to change the load resistor, R.



The value for C is limited by the physical size, any capacity greater than 100 mmfd will be satisfactory, the value of R should be 470 ohms when the probe is used in the IF stages to obtain the response of the grid circuit without effects from the tuned plate circuit whereas a value of 470K ohms is alright for general use,



For dial stringing use a light weight dial cord such as Bevin-Wilcox 6-18 Imperial silk cord.

Radio Band	Coil Adj.	Trimmer Adj.
A	560 KC	1500 KC
B	1.6 MC	4.7 MC
C	5 MC	10 MC
D	11.5 MC	22 MC
E	.....	105 MC

If replacement parts of identical manufacture and rating are not available for service repairs these should be ordered from Midwest Radio & Television Corporation, giving model number and serial number of the chassis and name of the part.

Repair data for the record changer mechanism is available separately, please specify Model.

CONTROLS AND OPERATION

LAMP SWITCH. The switch located in lamp socket must be turned in a clockwise direction to secure the three intensities of light if a three light bulb is used. If a standard single light bulb is used only one intensity of light will be obtained.

TUNING RANGE

This receiver is designed to operate over the standard broadcast band which extends from 535 to 1720 Kilocycles (KC) (174 to 560 Meters) and includes some police channels.

REPLACEMENT OF TUBES

(See Figure 1)

Remove the shades and lamp bulb to prevent damage. Next loosen screw H and slip off washer G and the dial F. Next unscrew E and the screw next to it. (These screws have red heads). At the top of lamp just below the lamp socket, will be found nut A which must be loosened sufficiently to allow collar B to be moved high enough to allow the two halves of the lamp base to be separated.

If tubes are removed from their sockets for test or replacement purposes, make certain that each tube is placed in its proper socket. (See tube layout diagram in the base of the lamp).

Failure to replace the tubes in their proper sockets may result in damage to the tube, or the receiver, or both.

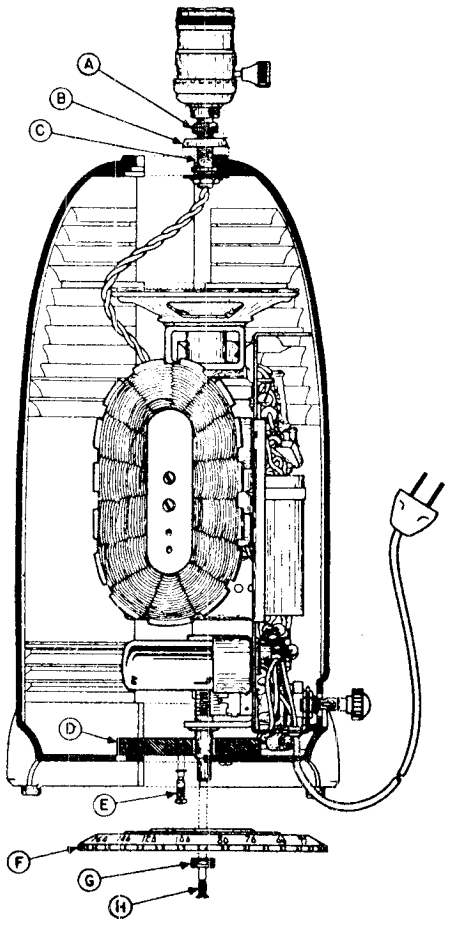

FIGURE 1.

SERVICE DATA

Lack of sensitivity and poor tone quality may be due to any one or a combination of causes such as weak or defective tubes or speaker, open or grounded bias resistor, bypass condenser, etc. Never attempt to realign set until all other possible sources of trouble have been first thoroughly investigated and definitely proved not to be the cause.

NOTE: IT IS ABSOLUTELY NECESSARY THAT AN ACCURATELY CALIBRATED TEST OSCILLATOR WITH SOME TYPE OF OUTPUT MEASURING DEVICE BE USED WHEN ALIGNING THE RECEIVER AND THAT THE PROCEDURE BE CAREFULLY FOLLOWED, OTHERWISE THE RECEIVER WILL BE INSENSITIVE AND THE DIAL CALIBRATION WILL BE INCORRECT. THE TRIMMERS WILL BE REFERRED TO BY THEIR FUNCTION AS INDICATED ON THE PARTS DIAGRAM.

ALIGNMENT PROCEDURE

GENERAL DATA. The alignment of this receiver requires the use of a test oscillator that will cover the frequencies of 455, 600, 1400 and 1720 KC and an output meter to be connected across the primary or secondary of the output transformer. If possible, all alignments should be made with the volume control on maximum and the test oscillator output as low as possible to prevent the AVC from operating and giving false readings.

CORRECT ALIGNMENT PROCEDURE. The intermediate frequency (I.F.) stages should be aligned properly as the first step. After the I.F. transformers have been properly adjusted and peaked, the broadcast band should be adjusted.

I.F. ALIGNMENT. Remove the chassis and loop antenna from the cabinet and set them up on the bench so that they occupy exactly the same respective positions on the bench as they did in the cabinet. Care should be taken to have no iron or other metal near the loop. Do not make this set-up on a metal bench. With the gang condenser set at minimum, adjust the test oscillator to 455 KC and connect the output to the grid of the first detector tube (12SA7) through a .05 or .1 mfd. condenser. The ground on the test oscillator should be connected to the ground buss, indicated on the circuit diagram. Align all three I.F. trimmers to peak or maximum reading on the output meter.

BROADCAST BAND ALIGNMENT. Connect the test oscillator to a dummy loop which can be made by coiling 2 turns of hookup wire about 6" in diameter. Place this dummy loop about a foot from the loop on the receiver and in the same plane as the receiver loop. With the gang condenser set at minimum capacity, set the test oscillator at 1720 KC, and adjust the oscillator (or 1720 KC trimmer) on the gang condenser. Next—set the test oscillator at 1400 KC, and tune in the signal on the gang condenser. Adjust the antenna trimmer (or 1400 KC trimmer) for maximum signal. Next set the test oscillator at 600 KC, and tune in signal on condenser to check alignment of coils.

MODEL 84BR-2726B

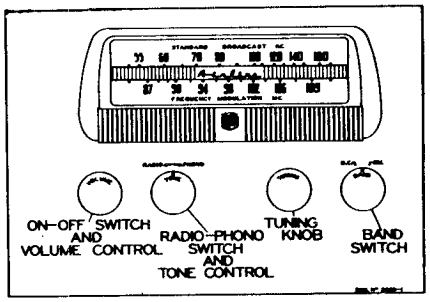
GENERAL DESCRIPTION

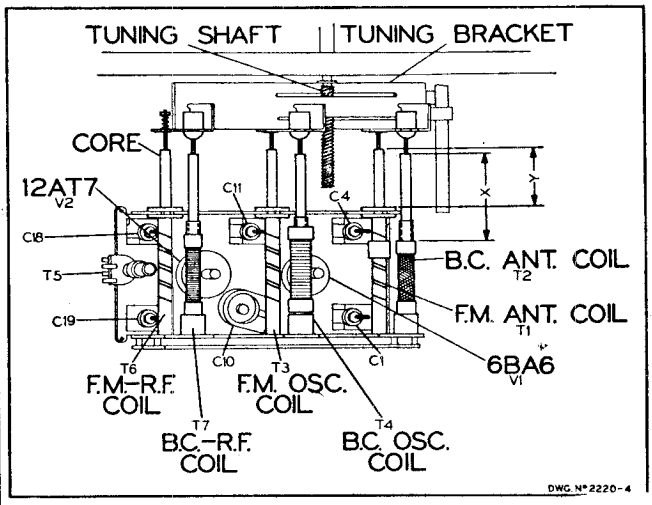
This is a 2-band, seven tube (plus rectifier) superheterodyne receiver for the reception of both AM and FM stations. It features the most advanced type of FM ratio detector, permeability tuning of both bands, combination double-frequency I.F. coils and miniature tubes. Built-in antennas are provided for broadcast and FM reception; provision is also made for connection of an external broadcast antenna as well as an FM antenna with a 300 ohm lead-in. Both antennas may be connected to the radio at the same time.

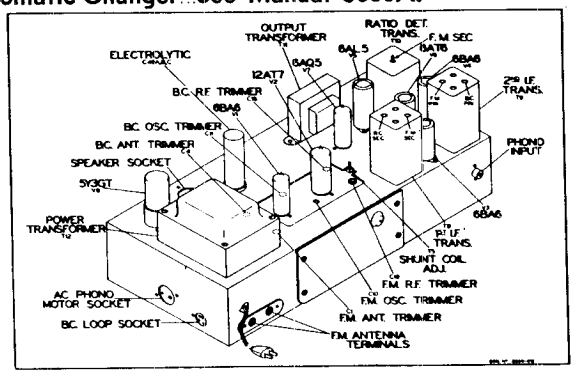
The phonograph is equipped with an automatic changer which plays up to ten 12-inch records or twelve 10-inch records at one loading.

ELECTRICAL SPECIFICATIONS

Power Supply	105 to 125 volts, AC, 60-cycles; Chassis only 75 watts. With phono operation 100 watts.
Frequency Ranges	Broadcast Band—535 to 1620 kc. FM Band— 88 to 108 mc.
Intermediate Freq.	AM-455 kc.; FM-10.7 mc.
Selectivity	AM-42 kc. broad at 1000 times signal, measured at 1000 kc.
	I.F. FM-200 kc. broad at 2 times down.
	I.F. FM-400 kc. broad at 10 times down.
AM Sensitivity	(For .5 watt output with external antenna)—5 microvolts average.
FM Sensitivity	(For .5 watt output)—25 microvolts average.
Power Output	2 watts, 10% distortion. 4 watts maximum.
Loud Speaker	12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.
Tube and Lamp Complement	6BA6, FM—AM R.F. stage.
	12AT7, FM—AM oscillator and mixer.
	6BA6, FM—AM 1st I.F.
	6BA6, FM—2nd I.F.
	6AL5, FM ratio detector.
	6AT6, AM detector. A.F. AMP. and A.V.C.
	6AQ5, Audio output.
	5Y3, rectifier.
	T-44 dial lamp (2 used).
Automatic Changer	See Manual 5068A.







Chassis—top view

TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.

©John F. Rider

MODEL 84BR-2726B

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 2400 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T9 AM windings. See top and bottom views	Maximum output Should be ½ watt
455 Kc. Use 70 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T8 AM windings. See top and bottom views	Maximum output Should be ½ watt
400 cycles. Use 60 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

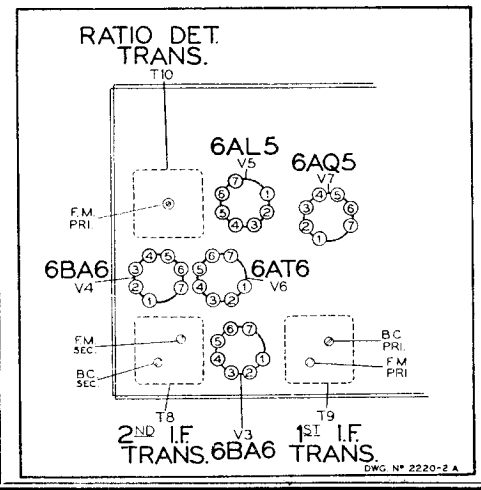
BROADCAST BAND - R. F. ALIGNMENT

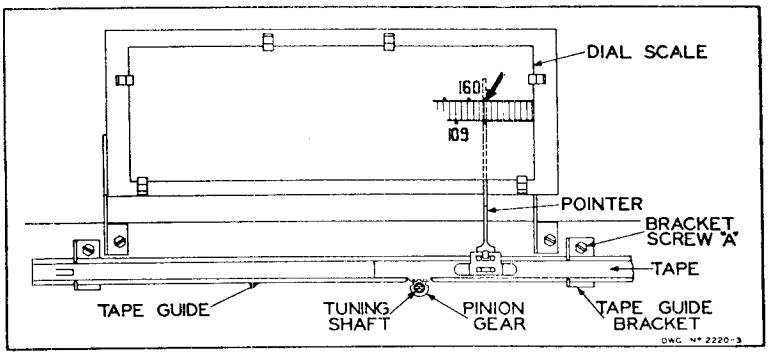
Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc.	AM Antenna and Ground	200 mmf.	C11 Osc. trimmer for maximum
535 Kc.	AM Antenna and Ground	200 mmf.	T5 for maximum ½ watt
1620 Kc. Use 5 microvolts	AM Antenna and Ground	200 mmf.	C4 and C18 for max. ½ watt. See note

NOTE: Recheck first two adjustments after this adjustment because of inter-locking effects.

Procedure for disassembly and assembly of dial mechanism.





TO ALIGN POINTER— Loosen bracket screw "A". Then tape guide bracket can be moved up to allow proper meshing of tape teeth with pinion gear. Readjust bracket to eliminate backlash.

© John F. Rider

MODEL 84BR-2726B

ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin No. 2 of 6AL5 and ground	Primary of T10	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T10	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of T9 10.7 m.c. windings See top and bottom views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin No. 2 of 12AT7 and ground	Pin No. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T8 See top and bottom views	Resonance should be about 3 volts

NOTE ON FM - I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube volt-meter between the mid-point of the resistors and points zz.

NOTE "B" If T10 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

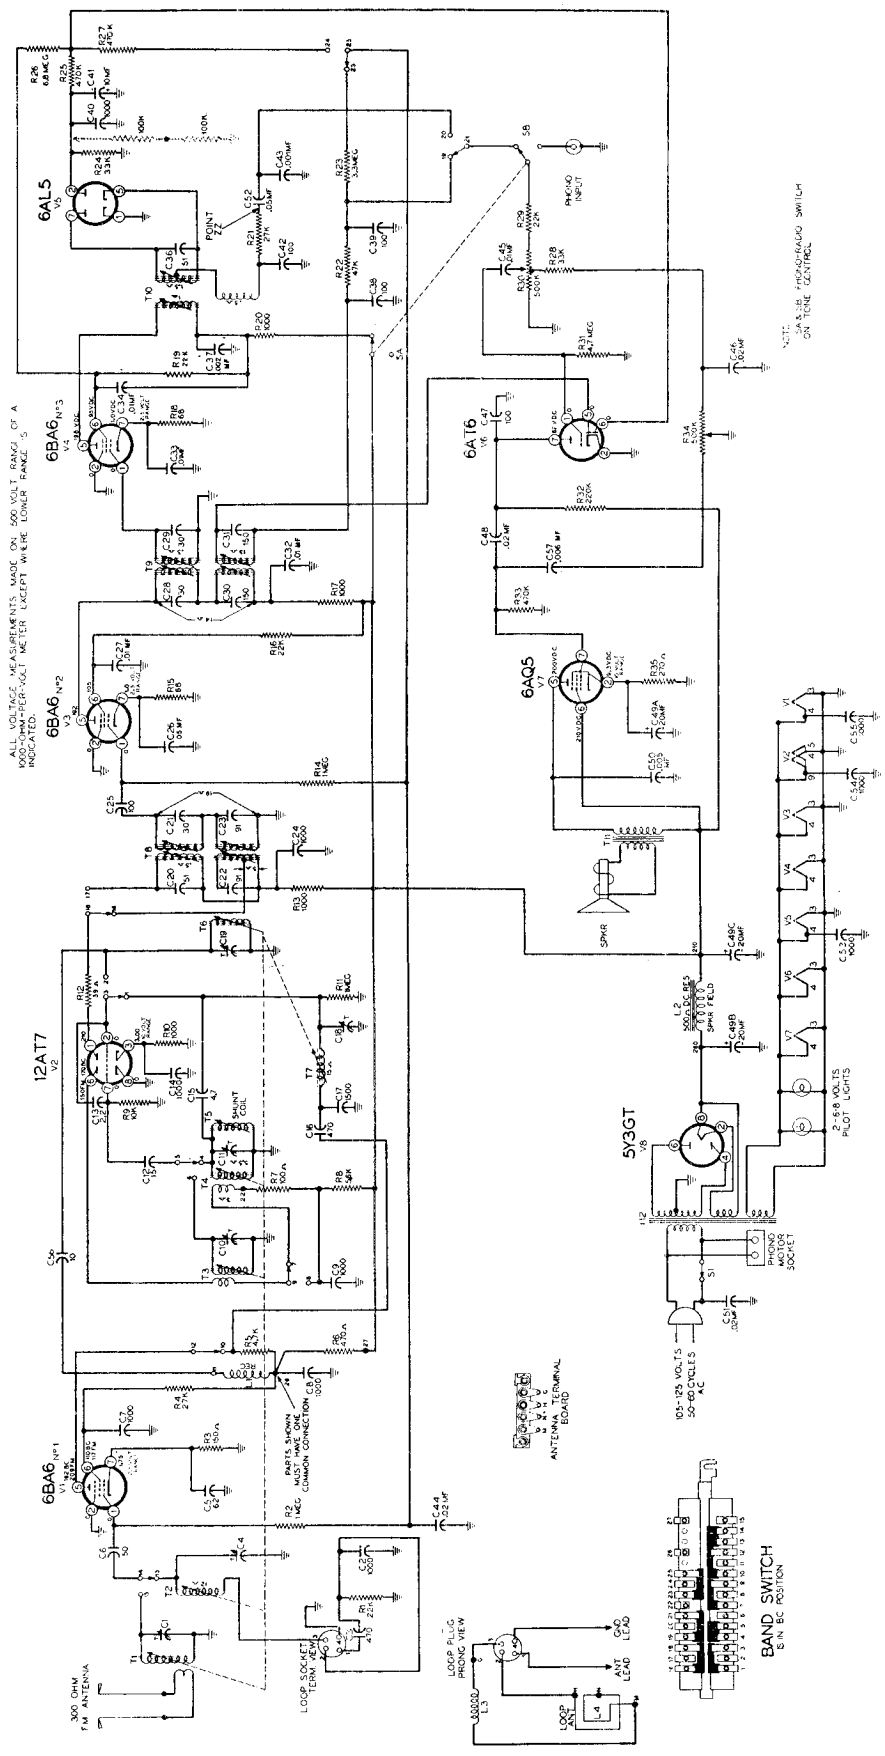
Check pointer so that it coincides with the marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 25 microvolts	FM Antenna Terminals See note	300 ohms	C10 Osc. C19 R.F. C1 Ant.	Pin No. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts. NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw.

© John F. Rider

MODEL 84BR-2726B



NOTE: The two 100K ohm resistors in series from Pin No. 2 to ground are connected as shown only when aligning the FM I.F. Refer to FM I.F. alignment procedure

MODEL 84BR-2733A

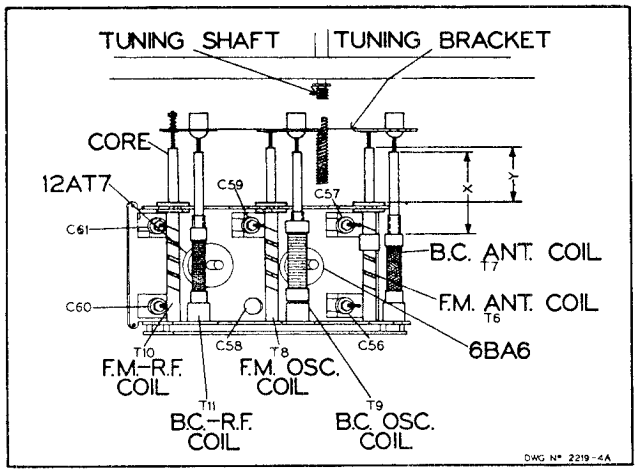
GENERAL DESCRIPTION

This is a 2-band, nine tube (plus rectifier) superheterodyne receiver for the reception of both AM and FM stations. It features the most advanced type of FM ratio detector, permeability tuning of both bands, combination double-frequency I.F. coils and miniature tubes. Built-in antennas are provided for broadcast and FM reception; provision is also made for connection of an external broadcast antenna as well as an FM antenna with a 300 ohm lead-in. Both antennas may be connected to the radio at the same time.

The phonograph is equipped with an automatic changer which plays up to ten 12-inch records or twelve 10-inch records at one loading.

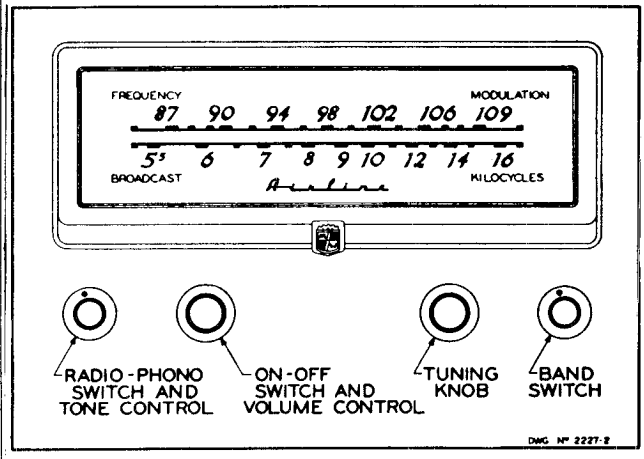
ELECTRICAL SPECIFICATIONS

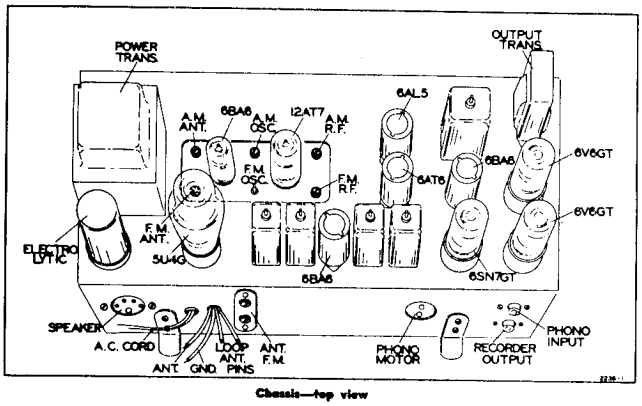
Power Supply	105 to 125 volts, AC, 60-cycles; Chassis only 122 watts. With phono operation 150 watts.
Frequency Ranges	Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.
Intermediate Freq.	AM-455 kc.; FM-10.7 mc.
Selectivity	AM-48 kc. broad at 1000 times signal, measured at 1000 kc. I.F. FM-180 kc. broad at 2 times down. I.F. FM-320 kc. broad at 10 times down.
AM Sensitivity	(For .5 watt output with external antenna)—3 microvolts average
FM Sensitivity	(For .5 watt output—10 microvolts average.
Power Output	8 watts, 10% distortion. 10 watts maximum.
Loud Speaker	12" electrodynamic. Voice coil impedance 3.2 ohms, 400 cycles.
Tube and Lamp Complement	6BA6, FM—AM R.F. stage. 12AT7, FM—AM oscillator and mixer. 6BA6, FM—AM 1st I.F. 6BA6, FM— 2nd I.F. 6AL5, FM— ratio detector. 6AT6, AM detector. A. F. AMP. and A.V.C. 6SN7, Push-pull. Driver and phase-inverter. 5U4G, rectifier. 6V6, output. 6V6, output. T-44 dial lamp (2 used).
Automatic Changer	See Manual 5068A.



TUNER ADJUSTMENT

With tuner all the way out, dimension "X" should be 1½ inches. "Y" should be 1-1/16 inches. "X" is from the end of the slug to the edge of the coil winding. Check these dimensions before R.F. alignment is attempted of either the AM or FM band. No slug adjustment should be necessary since the slugs are properly set at the factory.





Chassis—top view

ALIGNMENT PROCEDURE

Broadcast Band Section I.F. and R.F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of ½ watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.3 volts AC across this resistor will be approximately equivalent to a ½-watt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum freble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissible.

AM - I. F. ALIGNMENT

Band Switch in AM Position. Tune Set to 1400 Kc. Dummy Antenna .1 Mfd.

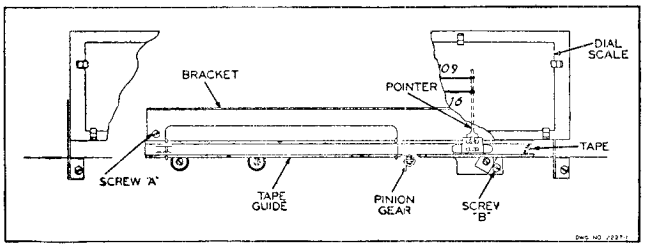
SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
455 Kc. Use 1000 microvolts	Pin No. 1 of 6BA6 No. 2 and ground	Primary and Secondary of T4 AM windings. See IF views	Maximum output Should be ½ watt
455 Kc. Use 30 microvolts	Pin No. 2 of 12AT7 and ground	Primary and Secondary of T3 AM windings. See IF views	Maximum output Should be ½ watt
400 cycles. Use 28 millivolts	Hot end of volume control and ground	None	Maximum output Should be ½ watt

BROADCAST BAND - R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST
1620 Kc. Use 3 microvolts	AM Antenna and Ground	200 mmf.	C59, C57, C61 For maximum, ½ watt

Procedure for disassembly and assembly of dial mechanism



TO ALIGN POINTER—Loosen bracket screw "A". Then tape guide bracket can be moved up to allow proper meshing of tape teeth with pinion gear. Readjust bracket to eliminate backlash.

© John F. Rider

MODEL 843R-2733A

ALIGNMENT PROCEDURE

FM Band Section. I.F. and R.F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over long periods of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube volt-meter which has a "floating ground". In other words, the meter, when used as a vacuum tube volt-meter, can have both the positive and negative sides connected to points above ground and still give true readings.

A standard AM signal generator is required.

FM - I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	Pin no. 2 of 6AL5 and ground	Primary of T5	Resonance should be about 3 volts
10.7 Mc. Use about .1 volt	Pin No. 1 of 6BA6 no. 3 and ground	See note "A"	Secondary of T5	Zero. Use zero center scale. See note "B"
10.7 Mc. Use about 3300 microvolts	Pin No. 1 of 6BA6 no. 2 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of T4A 10.7 m.c. windings See IF views	Resonance should be about 3 volts
10.7 Mc. Use about 200 microvolts	Pin no. 2 of 12AT7 and ground	Pin no. 2 of 6AL5 and ground	Primary and Secondary of 10.7 m.c. windings of T3A See IF views	Resonance should be about 3 volts

NOTES ON FM—I.F. ALIGNMENT

NOTE "A" Connect two resistors, 100K OHMS each, from Pin No. 2 of 6AL5 to ground. These resistors must be matched within 5%. Connect as shown in dotted lines on schematic diagram. Connect vacuum tube voltmeter between the mid-point of the resistors and point zz.

NOTE "B" If T5 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necessary.

GENERAL: Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM - R. F. ALIGNMENT

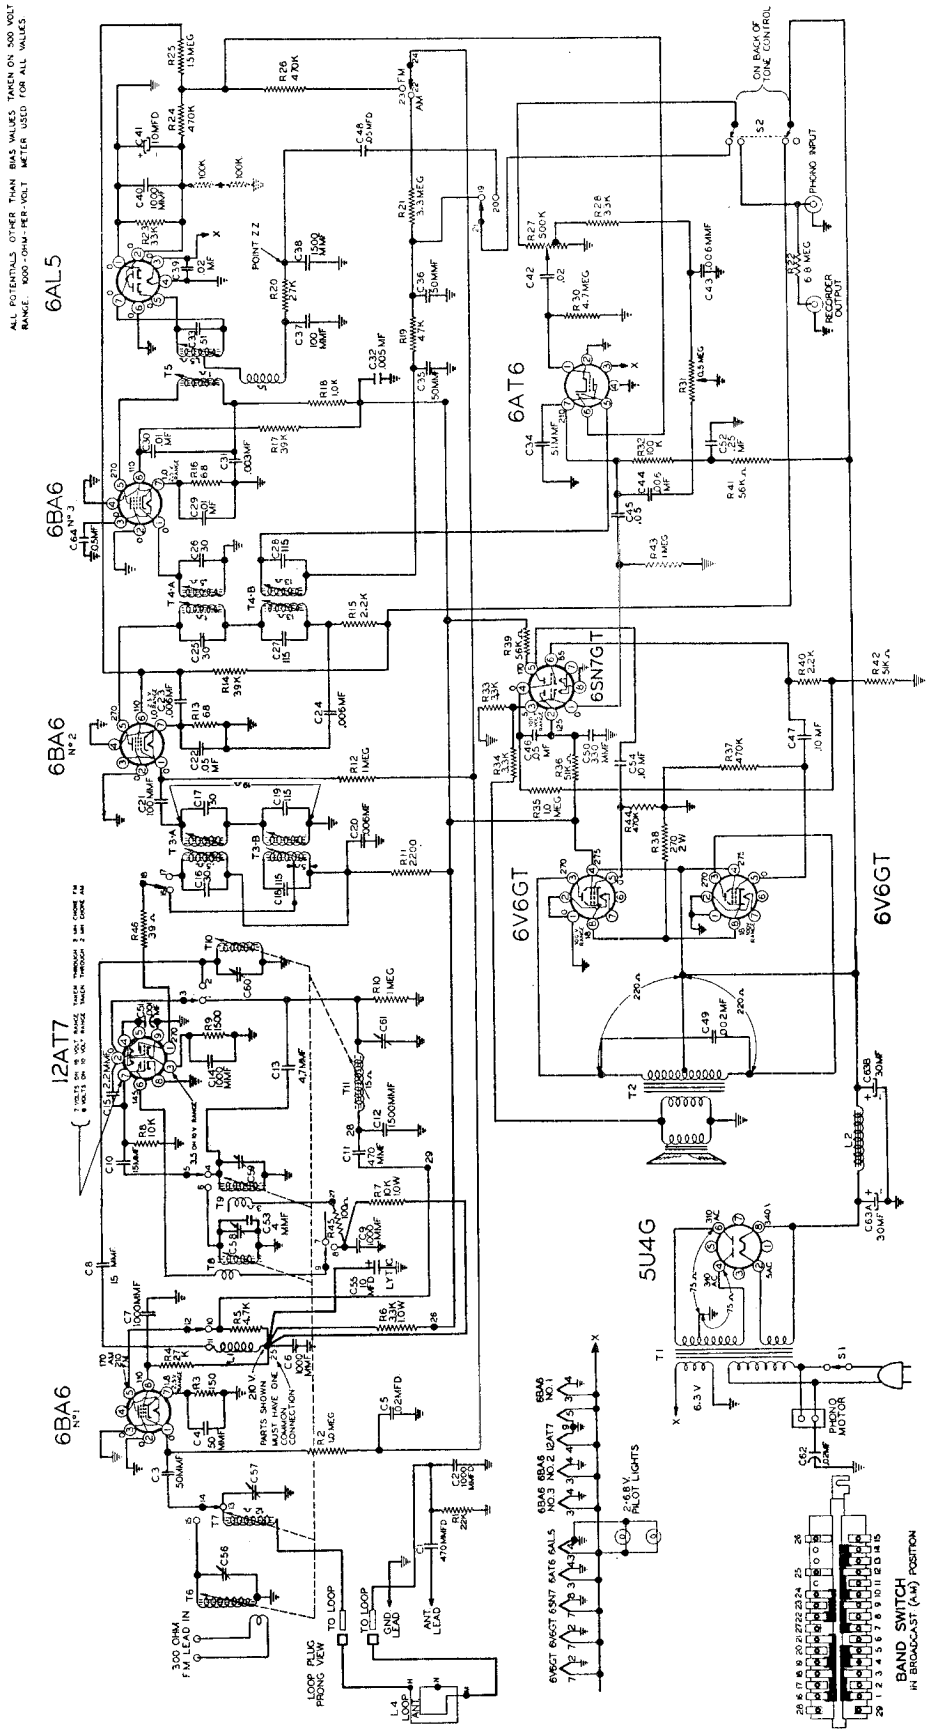
Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of marker to the extreme right when iron cores are all the way out. For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	DUMMY ANTENNA	ADJUST	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUST TO
100 Mc. Use about 10 microvolts	FM Antenna Terminals See note	300 ohms	C58 Osc. C60 R.F. C56 Ant.	Pin no. 2 of 6AL5 and Ground	Resonance about 3 volts

NOTE: If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. Use extreme care in picking harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube volt-meter as above for resonance indication. A weak carrier, however will not produce 3 volts. NOTE: Connect 300 ohms in series with hot side of generator and connect to one screw. Connect cold side of generator to other screw

© John F. Rider

MODEL 84BR-2733A



NOTE: Two 100K ohm resistors in series from Pin No. 2 of the 6AL5 to ground are connected as shown only when aligning the FM I. F. Refer to FM I. F. alignment procedure.

NOTE: B.C. Oscillator Coil T9 and number 7 terminal of slide switch should be connected together.

NOTE: Resistor R22 removed; with shielded wire from recorder output jack to radio side of radio-phono switch S2 added.

RECORD CHANGER: See Webster Model 246, Pages RCD.CH. 20-12

ALIGNMENT PROCEDURE

Removal of the receiver chassis from the cabinet requires the use of other calibration means than the dial glass. Calibration strips mounted on the pointer rails are provided for alignment purposes.

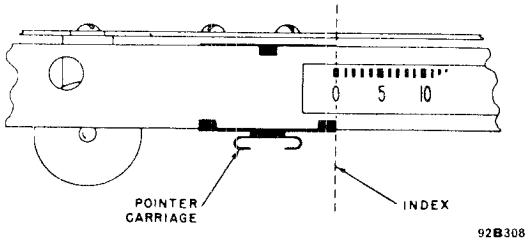
To use these calibration strips, it is necessary to remove the dial plate (brown metal cover) in the following manner:

1. Remove dial pointers. Pull them straight out of their spring clips.
2. Remove the two dial lamp sockets.
3. Remove dial plate fastened to the chassis with seven sheet metal screws.

With the variable condensers fully meshed, the right hand side of the pointer carriage will be indexed to zero on the calibration strips.

The receiver is equipped with AUTOMATIC FREQUENCY CONTROL on the FM band to compensate for mechanical variations in the pushbutton mechanism. The correction factor is approximately 5 times: AFC takes hold 100 kc before the station frequency is reached and releases before tuning 450 kc passed the station frequency when receiving a 0.1 volt signal.

The standard RMA dummy specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.



Calibration strip detail.

ALIGNMENT CHART

Step	Dummy Antenna	Signal Generator Coupling	Signal Generator Frequency	Band Switch Pos.	Radio Tuned To	Cal. No.	Adjust	Remarks
1	0.01 mfd. cap.	To stator plates of center section of AM tuning cap.	455 kc	"BC"	1000 kc	55	S3, S6, S2, S5, S1 & S4	Adjust for max. output. TREBLE tone control set at No. 1.

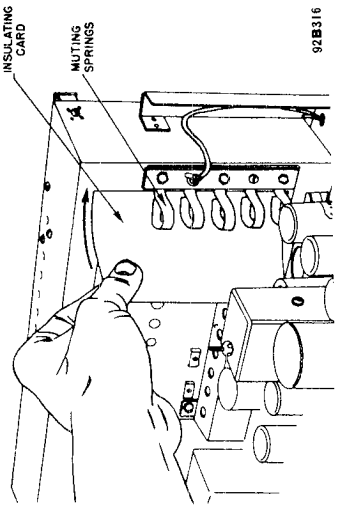
BUTTON SETTING

Insulate the muting switch contacts before setting the left hand group of AM pushbuttons. See Fig. 2. The right hand group of pushbuttons do not require insulation.

1. Select any one pushbutton.
2. Pull translucent insert straight out.
3. Insert screw driver blade through large hole of push-button into slot of locking screw. (See Fig. 1.)
4. Loosen locking screw about one-half turn. (Not more than one full turn.)
5. With pushbutton depressed, carefully tune in desired station with the manual control and tighten the locking screw.
6. Replace the translucent insert with the proper station call letters inserted as shown in Fig. 3.



Insulating the muting switch contacts.

DIAL CORD STRINGING INSTRUCTIONS

To restring either the "FM" or "AM" dial drive systems, cut a five foot length of 9 lb. test dial cord and follow the stringing procedure illustrated in Fig. 4. Note that the start and finish of both drives are located at the tension spring on the drum.

Index the pointer carriage as described under ALIGNMENT PROCEDURE.

GENERAL DESCRIPTION

This model is a 14 tube (plus rectifier tube) superheterodyne console radio with an automatic record changer. A built-in loop provides signal pick-up for the standard (540-1700 kc) broadcast band. A built-in folded doublet type antenna with 300-ohm transmission line serves primarily as the FM antenna and also as a pick-up for the shortwave bands. Separate manual tuning controls are provided for FM and AM (including SW) reception. Two sets of five mechanical pushbuttons are provided for FM and AM automatic tuning. Automatic frequency control is provided for FM reception to compensate for thermal drift and mistuning encounter button control. Separate bass and treble cont to provide maximum tone control over the re audio system. The band switch provides for se frequency channels and phono operation. The f channels consist of the FM band (88-108 mc broadcast band (540-1700 kc) and three SW bands (15-18 mc) (9-12 mc) and (5.8-18 mc). shortwave bands are "spread bands" to prov sirable tuning in the SW broadcast bands.

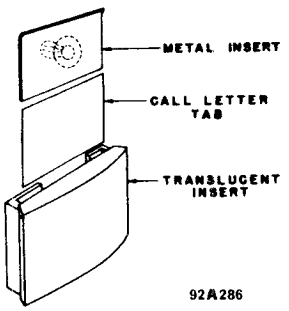
INSERTING CALL LETTERS

1. Slide out metal insert from translucent button assembly. (See Fig. 3.)
2. Insert desired call letter tab.
3. Replace metal insert behind call letter tab.
4. Replace translucent insert assembly into push-button mechanism.



Call letter installation.

Fig. 1. View showing pushbutton setup.

BUTTON SETTING

Insulate the muting switch contacts before setting the lower group of AM pushbuttons. See Fig. 2. The upper group of pushbuttons do not require insulation.

1. Select any one pushbutton.
2. Pull translucent insert straight out.
3. Insert screw driver blade through large hole of push-button into slot of locking screw. (See Fig. 1.)
4. Loosen locking screw about one-half turn. (Not more than one full turn.)
5. With pushbutton depressed, carefully tune in desired station with the manual control and tighten the locking screw.
6. Replace the translucent insert with the proper station call letters inserted as shown in Fig. 3.

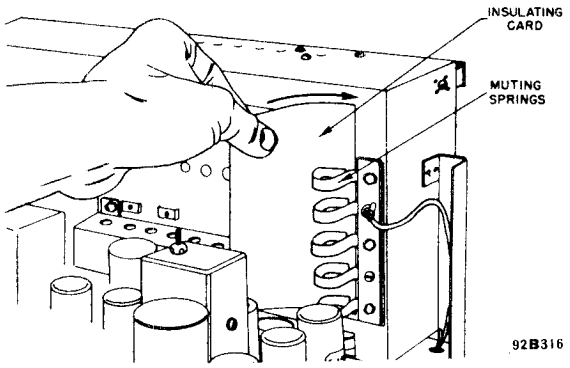

Fig. 2. Insulating the muting switch contracts.

INSERTING CALL LETTERS

1. Slide out metal insert from translucent button assembly. (See Fig. 3.)
2. Insert desired call letter tab.
3. Replace metal insert behind call letter tab.
4. Replace translucent insert assembly into push-button mechanism.

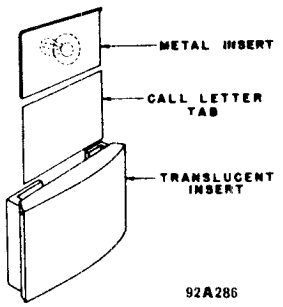

Fig. 3. Call letter installation.

DIAL CORD STRINGING INSTRUCTIONS

To restring either the "FM" or "AM" dial drive systems, cut a five foot length of 9 lb. test dial cord and follow the stringing procedure illustrated in Fig. 4. Note that the start and finish of both drives are located at the tension spring on the drum.

Index the pointer carriage as described under ALIGNMENT PROCEDURE.

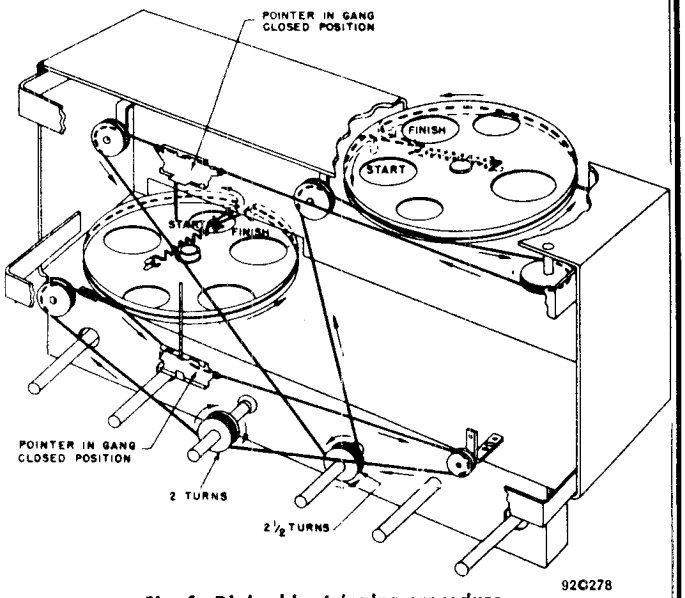

Fig. 4. Dial cable stringing procedure.

ALIGNMENT PROCEDURE

Removal of the receiver chassis from the cabinet requires the use of other calibration means than the dial glass. Calibration strips mounted on the pointer rails are provided for alignment purposes.

To use these calibration strips, it is necessary to remove the dial plate (brown metal cover) in the following manner:

1. Remove dial pointers. Pull them straight out of their spring clips.
2. Remove the two dial lamp sockets.
3. Remove dial plate fastened to the chassis with seven sheet metal screws.

With the variable condensers fully meshed, the right hand side of the pointer carriage will be indexed to zero on the calibration strips. Refer to Fig. 5.

The receiver is equipped with AUTOMATIC FREQUENCY CONTROL on the FM band to compensate for mechanical variations in the pushbutton mechanism. The correction factor is approximately 5 times: AFC takes hold 100 kc before the station frequency is reached and releases before tuning 450 kc passed the station frequency when receiving a 0.1 volt signal.

The standard RMA dummy specified in the alignment chart consists of a 200 mmf condenser in series with a 20 uh r-f choke which is shunted by a 400 mmf condenser in series with a 400 ohm carbon resistor.

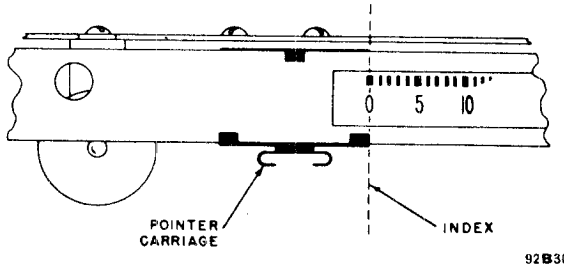

Fig. 5. Calibration strip detail.

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generctor with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. Pri. and Sec. (9) and (10)	Maximum Output
455 KC	Control Grid 6BE6 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BE6 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-39	Maximum Output
1400 KC	External Antenna Lead	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-35	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor — .01 mf, 300 ohms and 100K ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

	SIGNAL GENERATOR		THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO					
Discriminator	10.7 MC	6BA6 2nd I-F Pin 1 and Chassis	.01 mf	FM	Rotor Fully Open	Disc. Pri. (1) Note A	Maximum Deflection

	10.7 MC	Same as above	.01 mf	FM	Rotor Fully Open	1st I-F Sec. (6) Note C	Maximum Deflection
RECHECK I-F ADJUSTMENTS IN ORDER GIVEN							
Ant. and Osc.	108.5 Note D	Disconnect built-in line antenna and connect generator to dipole terminals with resistor in series	300 ohms	FM	Rotor Fully Open	Osc. C-38	Maximum Deflection
	104.5	Same as above	300 ohms	FM	Tune rotor for max. AVC voltage	Ant. C-37	Maximum Deflection
RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN							

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the A.V.C. line at the 27 K. ohm resistor (R-11) and its junction with terminal strip. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from A.V.C. and connect it at the audio takeoff point at the 1 megohm resistor (R-14) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Remove the 100 K. ohm load resistor and solder the lead from pin 7 of 6BE6 tube to the band switch before attempting to check the antenna and oscillator adjustments.

©John F. Rider

RECEIVER STAGE SENSITIVITIES
AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

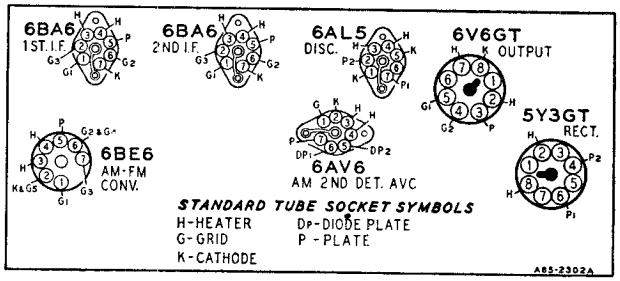
SIGNAL GENERATOR				
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	INPUT FOR .5 WATT OUTPUT
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	25 Microvolts
1000 KC	.05 mf	6BE6 Converter Pin 7	Chassis	60 Microvolts
455 KC	.05 mf	6BE6 Converter Pin 7	Chassis	58 Microvolts
455 KC	.05 mf	6BA6 1st I-F Pin 1	Chassis	2400 Microvolts
400 cycles	.05 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.05 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

FM STAGES

The tables below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	INPUT FOR .5 WATT OUTPUT
98 MC	300 ohms	External Antenna Terminal	Chassis	200 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	1,000 Microvolts
10.7 MC	.01 mf	6BA6 2nd I-F Pin 1	Chassis	40,000 Microvolts



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.

ELECTRICAL SPECIFICATIONS

Power Supply.....105-125 volts AC 60 cycles, 60 watts, 80 watts with record changer.

Frequency Ranges.....Broadcast 540-1600 KC
Frequency Modulation 88-108 MC

Intermediate Frequency...AM—455KC
FM—10.7 MC

Selectivity.....AM—50 KC broad at 1000 times signal, measured at 1000 KC
I.F. FM—200 KC broad at 2 times down
I.F. FM—800 KC broad at 200 times down

AM Sensitivity.....(For .5 watt output with external antenna) 20 microvolts average

FM Sensitivity.....(For .5 watt output) 200 microvolts average

Power Output.....4.5 watts maximum
2.5 watts 10% distortion

Loud Speaker.....10" PM Dynamic

Voice Coil Impedance.....3.2 ohms 400 cycles

Tube and Dial Lamp Complement

GENERAL DESCRIPTION

This is a two band, six tube (plus rectifier tube) receiver with automatic record changer, for the reception of both AM and FM stations. The I-F stages use the latest type high gain miniature type tubes and built-in Air Wave Aerials are provided for the FM and Broadcast bands. Features include, compensator circuits to prevent oscillator drift, automatic volume control, beam power output stage, PM dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.

The receiver and record changer are housed in a console combination cabinet with controls provided for tuning, volume, tone and band or phono selection.

DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

MODEL 84WG-2721D

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

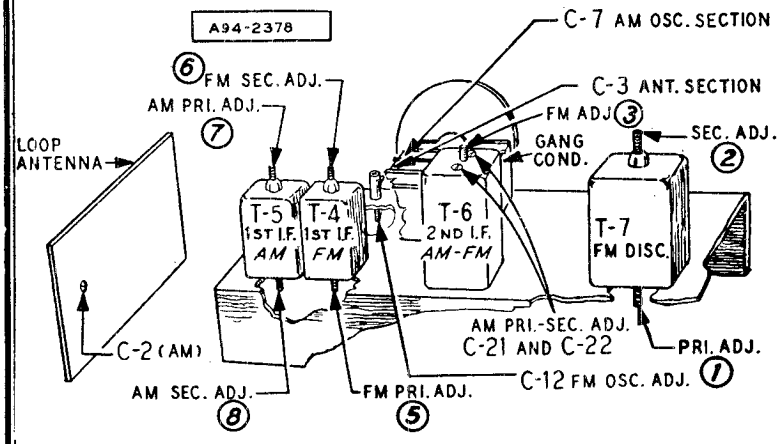
SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	10 Microvolts
1000 KC	.01 mf	6BA7 Converter Pin 7	Chassis	40 Microvolts
455 KC	.01 mf	6BA7 Converter Pin 7	Chassis	35 Microvolts
455 KC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2000 Microvolts
400 cycles	.01 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.01 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

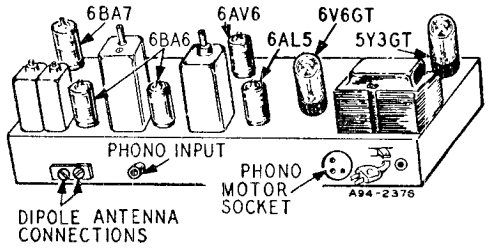
FM STAGES

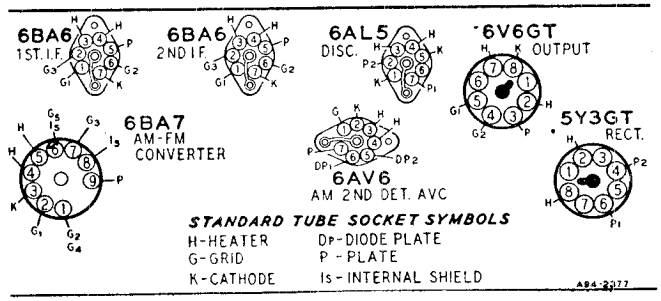
The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 MC	300 ohms	External Antenna Terminal	Chassis	100 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	600 Microvolts
10.7 MC	2500 mmf	6BA6 2nd I-F Pin 1	Chassis	23,000 Microvolts







TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC

Signal Input.....None

A variation of ±10% is usually permissible.

MODEL 84WG-2721D

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. C-21 and C-22	Maximum Output
455 KC	Control Grid 6BA7 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BA7 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-7	Maximum Output
1400 KC	External Antenna Lead	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-2	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms and a 3300 ohm .5 watt resistor with short leads.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

Antenna	104.5	Same as above	300 ohms	FM	Tune rotor for max. AVC voltage	Ant. C-3	Maximum Deflection
RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN							

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I-F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

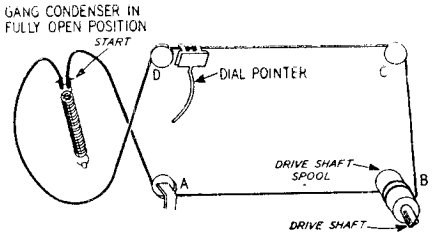
DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 50 inches long for the installation. Install the cord as shown in the illustration, winding three turns counterclockwise around the drive shaft spool with the turns progressing towards the front end of the drive shaft. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.



DIAL ROTATION CORD

Use a new 10X60 drive cord assembly or a new length of cord 20 inches long for the installation. Both the dial pulley and the band switch pulley must be turned to the short wave band position as shown in the illustration. Install the new cord exactly as shown then change the position of the band switch several times and note the movement of the dial.

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting an 8 ohm, 10 watt resistor across the secondary winding of the output transformer. A reading of 2 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	2 Microvolts
1000 KC	.05 mf	6BA6 Interstage Pin 1	Chassis	8 Microvolts
1000 KC	.05 mf	6BE6 Converter Pin 7	Chassis	65 Microvolts
455 KC	.05 mf	6BE6 Converter Pin 7	Chassis	55 Microvolts
455 KC	.05 mf	6BA6 1st I-F Pin 1	Chassis	2500 Microvolts
400 cycles	.05 mf	6AV6 1st A-F Pin 1	Chassis	.05 Volt
400 cycles	.05 mf	6V6GT Output Pin 5	Chassis	2.8 Volts

FM STAGES

The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 Mc	300 ohms	External Antenna Terminal	External Ant. Terminal	25 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2200 Microvolts
10.7 MC	.01 mf	6BA6 2nd I-F Pin 1	Chassis	50,000 Microvolts

ALIGNMENT PROCEDURE

AM BROADCAST AND SHORT WAVE BAND

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, 200 mmf and 400 ohms.

Volume Control—Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

	SIGNAL GENERATOR		THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO					
I-F	455 kc	6BE6 Pin 7 and Chassis	.1 mf	Broadcast	Rotor Fully Open	1st I-F Pri. & Sec. (3) & (4) 2nd I.-F. Pri. & Sec. (1) & (2)	Maximum Output

MODELS 84WG-2728A,
84WG-2734A

ALIGNMENT PROCEDURE

The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 5000 ohms.

FM STAGES

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.

Allow chassis and signal generator to warm up for several minutes.

	SIGNAL GENERATOR		THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR

R-F & Osc.	108.4	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Rotor Fully Open	Oscillator C-9 Note G	Maximum Deflection
	104.5	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Tune Rotor for Max. AVC voltage	RF. C-5	Maximum Deflection
	104.5	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Tune Rotor for Max. AVC voltage	Ant. C-2	Maximum Deflection
Recheck R-F and Osc. Adjustments in order given							

NOTE A—Test Equipment connections are as given in the table. The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line at the 1 megohm resistor R-40 and the band switch terminal for all adjustments except the discriminator secondary adjustment, for which see Note C.

NOTE B—A signal of .1 volt must be fed into the receiver for this adjustment.

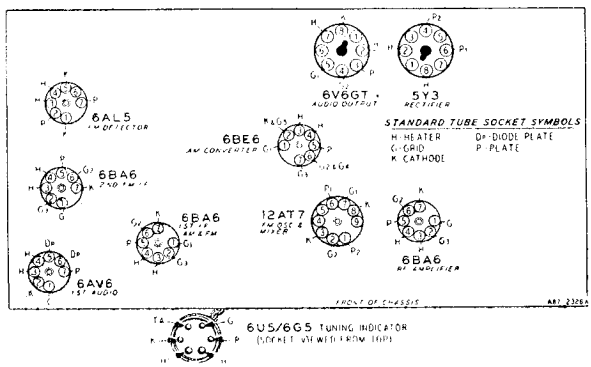
NOTE C—Disconnect zero center DC vacuum tube voltmeter from AVC and reconnect to junction of R-11, C-51 and C-52. Adjust for zero voltage indication.

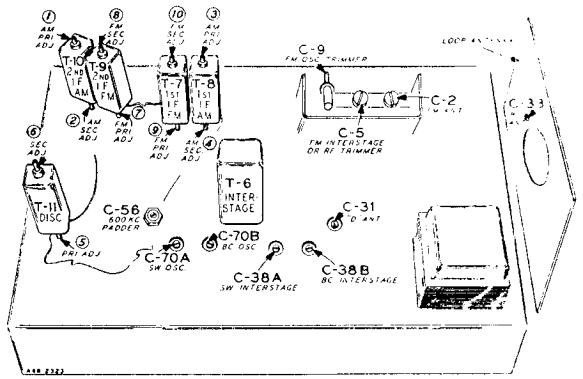
NOTE D—Before adjusting Pri. core connect 5000 ohm load resistor across the 2nd I.F. secondary terminals.

NOTE E—Disconnect 5000 ohm load resistor from secondary terminals and reconnect across the 2nd I.F. primary terminals.

NOTE F—Input can be reduced to 10,000 microvolts.

NOTE G—Oscillator frequency below signal frequency.





TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC

Signal Input.....None

A variation of ±10% is usually permissible.

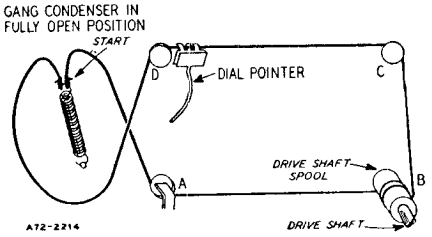
DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 50 inches long for the installation. Install the cord as shown in the illustration, winding three turns counterclockwise around the drive shaft spool with the turns progressing towards the front end of the drive shaft. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.



DIAL ROTATION CORD

Use a new 10X45 drive cord assembly or a new length of cord 20 inches long for the installation. Both the dial pulley and the band switch pulley must be turned to the short wave band position as shown in the illustration. Install the new cord exactly as shown then change the position of the band switch several times and note the movement of the dial.

MODELS 84WG-2732A, 84WG-2732B

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting an 8 ohm, 10 watt resistor across the secondary winding of the output transformer. A reading of 2 volts across this resistor will be equivalent to a .5 watt output. The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	2 Microvolts
1000 KC	.05 mf	6BA6 Interstage Pin 1	Chassis	8 Microvolts
1000 KC	.05 mf	6BE6 Converter Pin 7	Chassis	65 Microvolts
455 KC	.05 mf	6BE6 Converter Pin 7	Chassis	55 Microvolts
455 KC	.05 mf	6BA6 1st I-F Pin 1	Chassis	3500 Microvolts
400 cycles	.05 mf	6AV6 1st A-F Pin 1	Chassis	.045 Volt
400 cycles	.05 mf	6V6GT Output Pin 5	Chassis	1.65 Volts

FM STAGES

The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 Mc	300 ohms	External Antenna Terminal	External Ant. Terminal	25 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2200 Microvolts
10.7 MC	.01 mf	6BA6 2nd I-F Pin 1	Chassis	50,000 Microvolts

ALIGNMENT PROCEDURE

AM BROADCAST AND SHORT WAVE BAND

The following is required for aligning:

An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.

Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, 200 mmf and 400 ohms.

Volume Control—Maximum all Adjustments.

Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.

Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

ALIGNMENT PROCEDURE

FM STAGES

The following equipment is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 5000 ohms.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.

(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.

Allow chassis and signal generator to warm up for several minutes.

	104.5	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Tune Rotor for Max. AVC voltage	Ant. C-2	Maximum Deflection
Recheck R-F and Osc. Adjustments in order given							

NOTE A—Test Equipment connections are as given in the table. The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line at the 1 megohm resistor R-40 and the band switch terminal for all adjustments except the discriminator secondary adjustment, for which see Note C.

NOTE B—A signal of .1 volt must be fed into the receiver for this adjustment.

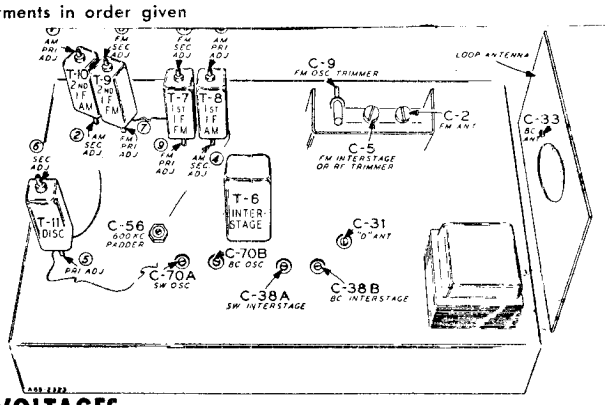
NOTE C—Disconnect zero center DC vacuum tube voltmeter from AVC and reconnect to junction of R-11, C-51 and C-52. Adjust for zero voltage indication.

NOTE D—Before adjusting Pri. core connect 5000 ohm load resistor across the 2nd I.F. secondary terminals.

NOTE E—Disconnect 5000 ohm load resistor from secondary terminals and reconnect across the 2nd I.F. primary terminals.

NOTE F—Input can be reduced to 10,000 microvolts.

NOTE G—Oscillator frequency below signal frequency.



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC

Signal Input.....None

A variation of ±10% is usually permissible.

OPERATION OF THE RADIO

BROADCAST BAND—This is the tuning band in which the standard broadcast stations operate. The upper scale on the dial covers the broadcast range of 535-1620 Kc., and is calibrated in channel numbers. To obtain the kilocycle reading, multiply the number on the dial by 10; thus 80 on the dial corresponds to 800 kilocycles.

FM BAND—The FM tuning range covers the newly allocated frequency-modulation band of 88 to 108 megacycles into which all FM stations are required to move. Check with your local newspaper to determine the frequency of your local FM stations.

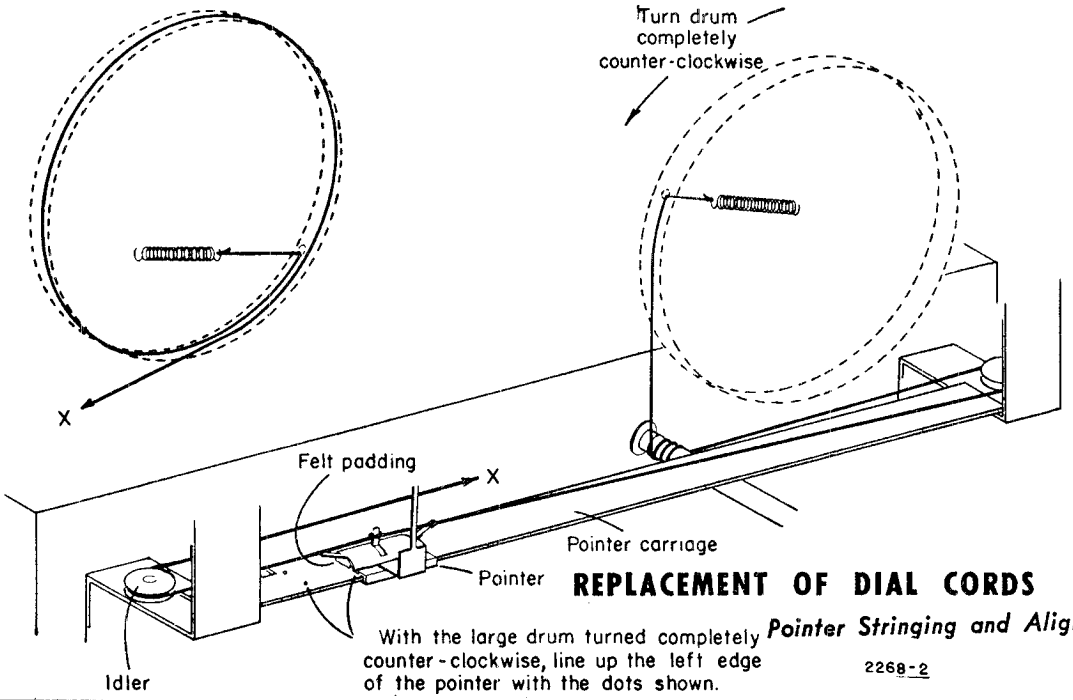
ON-OFF SWITCH AND VOLUME CONTROL—The knob second from the left is both the on-off switch and the volume control. When this control is turned all the way to the left the set is off. A slight rotation to the right will click the switch and turn the set on. The knob may then be used to regulate the volume. Be sure your set is turned completely off when not in use; otherwise the tubes will wear out unnecessarily.

TONE CONTROL—Rotating the extreme left hand knob gives a full variation of the tonal response from a deep bass to a brilliant treble.

TUNING KNOB—The knob second from the right is the tuning knob; rotation of this knob moves the indicator along the dial scales. When selecting a station turn the knob back and forth until the tone is clearest and loudest. Do not use the tuning knob to regulate volume; the volume control should be used for that purpose after the station has been tuned in properly. It is particularly important in FM reception to tune the station accurately; otherwise the tone is distorted and the background noise not eliminated.

BAND SWITCH—The knob on the extreme right is used to select FM BAND, BROADCAST BAND, or PHONO. When this knob is turned fully clockwise FM programs can be tuned in. In the center position STANDARD BROADCASTS can be heard.

PHONOGRAPH—To PLAY RECORDS through this radio, connect the "pickup lead" wire from record player to the "PHONO INPUT" on the cabinet back. Turn Bandswitch to PHONO and adjust volume as required.



REPLACEMENT OF DIAL CORDS

Pointer Stringing and Alignment

With the large drum turned completely counter-clockwise, line up the left edge of the pointer with the dots shown.

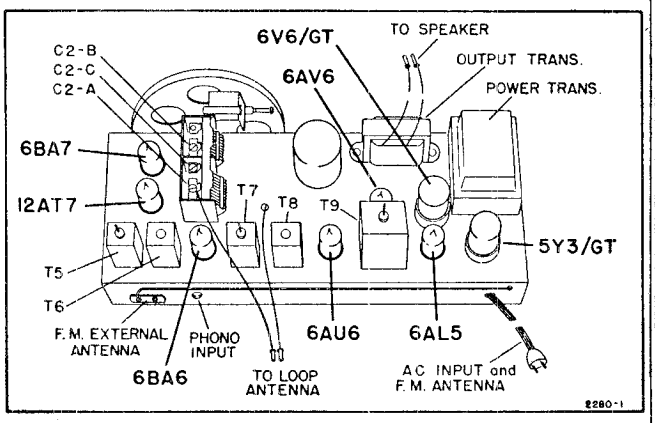
2268-2

ALIGNMENT PROCEDURE

Broadcast Band Section I. F. and R. F.

The alignment procedure below includes the sensitivities at the inputs of various stages. All signal input values are based on an output of 500 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2-ohm resistor across the secondary winding of the output transformer. A reading of 1.27 volts AC across this resistor will be approximately equivalent to 500 milliwatt output with the speaker connected. The volume control must be set at maximum. The tone control must be set for maximum treble.

The signal source must be an accurately calibrated signal generator capable of supplying the frequencies designated, modulated 30% with a 400-cycle audio signal. A 400 cycle audio signal is required for the audio measurement. Variations in sensitivities of plus or minus 25% are usually permissable.



Chassis View

AM—I. F. ALIGNMENT

Band Switch in AM Position, Gang Open, Dummy Antenna .1 Mfd.

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
400 cycles. Use 65 millivolts	High Side of Volume Control and chassis	None	Maximum output Should be 500 Milliwatts
455 Kc. Use 3300 microvolts	Pin 1 of 6BA6 I.F. Amp. and chassis	Primary and Secondary of T8. See chassis view.	Maximum output Should be 500 Milliwatts
455 Kc. Use 55 microvolts	Pin 7 of 6BA7 Converter and chassis	Primary and Secondary of T6. See chassis view.	Maximum output Should be 500 Milliwatts

BROADCAST BAND—R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of dial marker at the extreme left when gang is closed.
For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	SET POINTER AT	CONNECT TO RADIO	ADJUST
1620 Kc.	Extreme Right Calibration Marker	RADIATION COUPLING Use six turn loop across generator output. Place close to cabinet back.	Oscillator trimmer C2-B for maximum
1400 Kc.	Third Calibration from Right		Antenna Trimmer C2-A for maximum

Check tracking at 1000 Kc, 600 Kc, and 535 Kc to be sure oscillator is set correctly.

ELECTRICAL SPECIFICATIONS

Power Supply.....105 to 125 volts, AC, 60-cycles; Chassis only 75 watts.
Frequency Ranges.....Broadcast Band—535 to 1620 kc. FM Band—88 to 108 mc.
Intermediate Freq.....AM-455 kc.; FM-10.7 mc.
Selectivity.....AM-47 kc. broad at 1000 times signal, measured at 1000 kc.
I.F. FM-230 kc. broad at 2 times down.
I.F. FM-470 kc. broad at 10 times down.
AM Sensitivity.....(For .5 watt output)—200 microvolts per meter average.
FM Sensitivity.....(For .5 watt output)—30 microvolts average.
Power Output.....1.5 watts. 10% distortion. 3.0 watts maximum.
Loud Speaker.....5"x 7" PM. Voice coil impedance 3.2 ohms, 400 cycles.
Tube Complement.....
12AT7, FM-RF amp. mixer; 6AL5, FM detector;
6BA7, AM converter, FM oscillator; 6AV6, AM detector;
6BA7, IF amplifier; 6V6 output;
6AU6, FM driver; 5Y3, rectifier.

MODEL 94BR-1535A

ALIGNMENT PROCEDURE

FM Band Section I. F. and R. F.

A non-metallic alignment tool must be used.

IMPORTANT

No alignment of the FM section of this radio should be attempted unless you are positive that the circuits are in need of adjustment and you have the necessary equipment.

All components used in this radio are extremely stable and the tuned circuits should require no adjustment over a long period of time.

NOTE

The following alignment is based on the use of the new Simpson vacuum tube voltmeter which has a "floating ground". In other words, the meter, when used as a vacuum tube voltmeter, can have both the positive and negative sides connected to points above ground and still give true readings. (See note "C" below.)

A standard AM signal generator is required.

FM —I. F. ALIGNMENT

Band Switch in FM Position. Dummy Antenna .1 Mfd

SIGNAL GENERATOR FREQUENCY	CONNECTION TO RADIO	VACUUM TUBE VOLT METER CONNECTION TO RADIO	ADJUSTMENTS TO BE MADE	ADJUST FOR
10.7 Mc. Use about .05 volt	Pin No. 1 of 6AU6	Pin No. 7 of 6AL5 and chassis	Bottom Core Primary of T9 Ratio Detector	Resonance should be about 3 volts
10.7 Mc. Use about .05 volt	Pin No. 1 of 6AU6	See note "A"	Top Core Secondary of T9 Ratio Detector	Zero. Use zero center scale See note "B"
10.7 Mc. Use about 1800 microvolts	Pin No. 1 of 6BA6	Pin No. 7 of 6AL5 and chassis	Primary and Secondary of T7. FM Driver IF See chassis view	Resonance should be about 3 volts
10.7 Mc. Use about 400 microvolts	Top end of C2-C	Pin No. 7 of 6AL5 and chassis	Primary and Secondary of T5. FM Input IF See chassis view	Resonance should be about 3 volts

NOTES ON FM — I. F. ALIGNMENT

NOTE "A"—Connect two resistors in series, 100K OHMS each, from Pin No. 7 of 6AL5 to chassis (Pin No. 5). These resitors must be matched within 5%. Connect vacuum tube voltmeter between the midpoint of the resistors and point zz.

NOTE "B"—If T9 has been tampered with, it is possible that no crossover point will be found at first. Careful adjustment of both primary and secondary is necesary.

NOTE "C"—To use a VTVM which does not have the "floating ground" feature, in step 2 above, connect "ground" side of VTVM to midpoint of resistors (Note "A") and "high" side to point zz.

GENERAL—Input signals should be adjusted to give approximately 3 volts. The ratio detector is operating at a reasonable level at this point and will give the truest indication of correct alignment with the procedure specified.

FM—R. F. ALIGNMENT

Check pointer so that the right hand edge of the pointer skirt coincides with the right hand edge of dial marker at the extreme left when gang is closed.

For adjustment, see dial mechanism illustration.

SIGNAL GENERATOR FREQUENCY	POINTER	CONNECTION TO RADIO	ADJUST	V T V M CONNECTIONS
108 mc.	108 mc. Marker	FM antenna terminals	FM Osc. C3 for maximum	Pin No. 7 of 6AL5 to chassis.
98 mc.	Tune in Gen. Signal	See Note "B" below	FM Mixer C2-C for maximum	

NOTE "A"—If a signal generator with the above fundamental frequency is not available, it is sometimes possible to use harmonics. An alternate procedure is to use a local station carrier of known frequency to align the FM Band and to use the vacuum tube voltmeter as above for resonance indication. A weak carrier, however, will not produce 3 volts.

NOTE "B"—Connect 300 ohms in series with "hot" side of generator and connect to left hand screw of external FM Antenna Terminals. Connect cold side of generator to right hand screw.

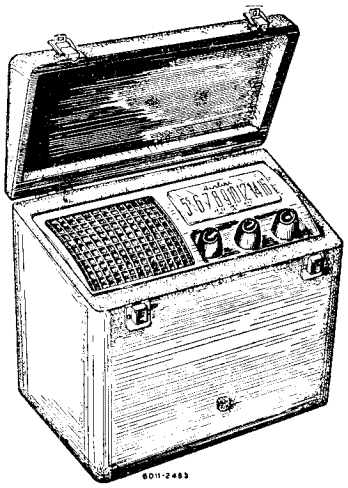
MODEL 94WG-1059A



ELECTRICAL SPECIFICATIONS

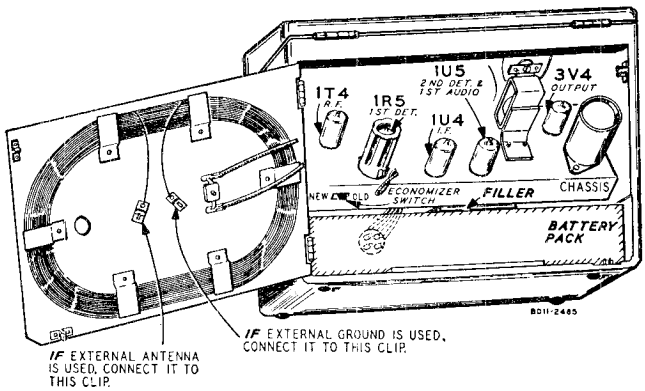
Power Supply	"A" Battery Supply—9 Volts, 50 Ma. "B" Battery Supply—90 Volts, 11 Ma. or 105-125 volts AC, 25-60 cycles, 12 watts or 105-125 volts DC
Battery Pack	Ward's Battery Pack No. 62-35
Frequency Range	540-1600 KC
Intermediate Frequency	455 KC
Selectivity	At 1000 KC, 45 KC wide at 1000 times signal
Sensitivity	(for .05 watt output with external antenna) 10 microvolts average
Power Output	0.3 watt maximum 0.125 watt 10% distortion
Loud Speaker	5¼" PM dynamic
Voice Coil Impedance	3.2 ohms at 400 cycles

Tube Complement

1 1R5 1st Detector
1 1U4 I-F Amplifier
1 1T4 R-F Amplifier
1 1U5 2nd Detector, AVC and 1st A-F Amplifier
1 3V4 Power Output

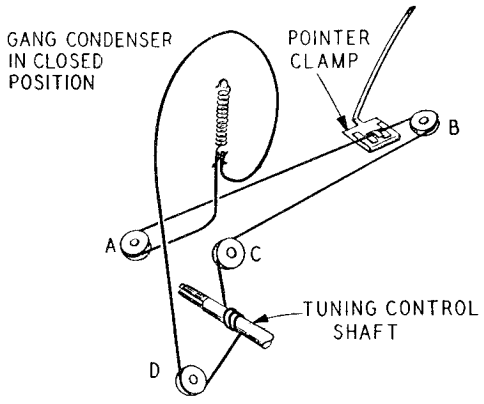
GENERAL DESCRIPTION

This model is a five tube AC-DC or battery operated portable radio. Controls are provided for tuning, volume and AC-DC or Battery selection. Other features include a built-in Air Wave Loop Aerial, automatic volume control, tuned R-F stage, PM dynamic speaker and a selenium rectifier for AC operation. The dial scale is calibrated to cover frequencies between 540 and 1600 kilocycles.



DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully closed position. Use a new 10X52 Drive Cord Assembly and fasten one end to the tension spring. Fasten the other end of the tension spring to the hook on the drive pulley. Pass the cord through the slot in the drive pulley rim and continue around pulley rim ¼ turn clockwise. Pass cord around pulleys A, B, and C as shown in the illustration. Wind three turns clockwise (viewed from rear of chassis) around tuning control shaft. The turns must progress toward rear of chassis. Pass cord around pulley D and continue ¾ turn clockwise around large drive pulley. Pass cord through the slot in the pulley rim then stretch the tension spring and fasten free end of cord to it.



REMOVAL OF CHASSIS FROM CABINET

Pull off the three control knobs and disconnect the battery plug. Remove the two wood screws holding the safety switch in place. Remove the four screws that fasten the chassis to the cabinet (2 on the outside at each end of the cabinet). Withdraw the chassis from the cabinet.

MODEL 94WG-1059A

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volt AC across this resistor will be equivalent to a 50 milliwatt output with the speaker connected. The volume control must be set to maximum.
The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Output variations of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Ext. Gnd. Clip	4.0 microvolts
1000 kc	.1 mf.	1T4 R-F—Pin 6	"X" Point	25 microvolts
455 kc	.1 mf.	1R5 1st Detector—Pin 6	"X" Point	90 microvolts
455 kc	.1 mf.	1U4 I-F—Pin 6	"X" Point	3500 microvolts
400 cycles	.1 mf.	1U5 1st A-F—Pin 6	"X" Point	.022 volt
400 cycles	.1 mf.	3V4 Output—Pin 3	"X" Point	1.8 volts

ALIGNMENT PROCEDURE

Volume Control—Maximum All Adjustments.
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.
The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.
Output Indicating Meter; Non-Metallic Screwdriver.
Dummy Antenna—.1 mf., 50 mmf.

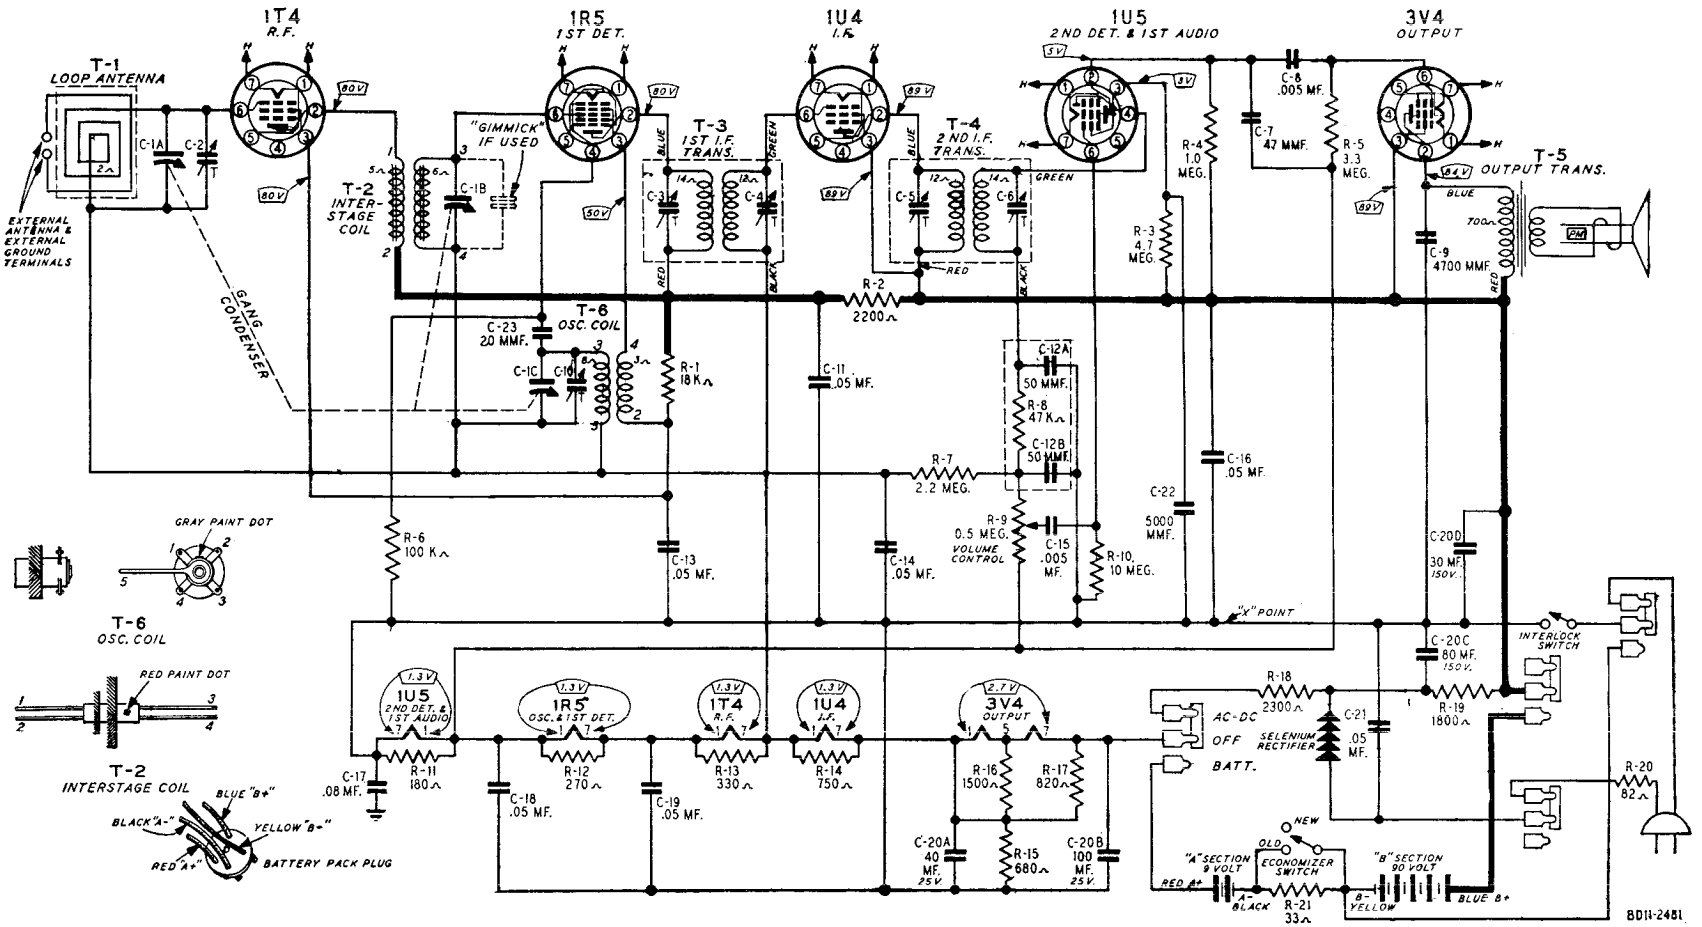
SIGNAL GENERATOR				CONDENSER SETTING	ADJUST TRIMMERS TO MAXIMUM See Trimmer Illustration
Frequency Setting	Coupling Capacitor	Connection to Radio	Ground Connection		
455 kc	.1 mf	Control Grid 1U4 I-F Pin 6	"X" Point	Turn Rotor To Full Open	2nd I-F (C-5) & (C-6)
455 kc	.1 mf	Control Grid 1R5 1st Det. Pin 6	"X" Point	Turn Rotor To Full Open	1st I-F (C-3) & (C-4)
1620 kc	.1 mf	Control Grid 1T4 R-F Pin 6	"X" Point	Turn Rotor To Full Open	Oscillator (C-10)
1400 kc	50 mmf	External Antenna Clip On Loop See Note A	External Ground clip on loop	Turn Rotor To Max. Output. Set Indicator to 1400 KC See Note B	Antenna (C-2)

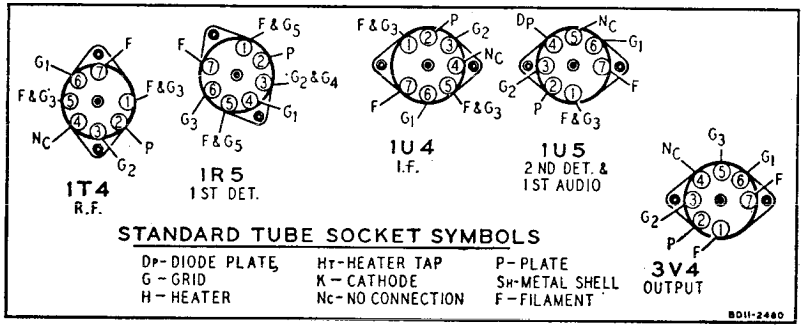
NOTE A—Re-assemble chassis in cabinet and close the cabinet back before making adjustment.

NOTE B—Tune in a 1400 KC signal. If pointer is not at the 1400 KC mark on the dial scale, move the pointer on the string to the 1400 KC mark.

©John F. Rider

©John F. Rider





TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals with set operating on AC. All voltages except those for the filaments are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

A variation of ±10% is usually permissible.

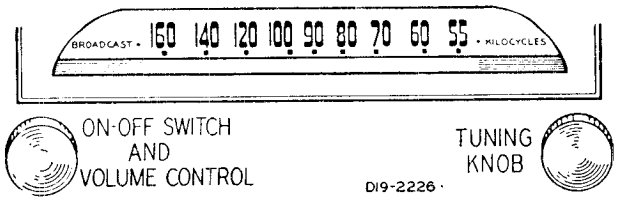
MODEL 94WG-1804D



GENERAL DESCRIPTION

This model is a five tube (plus rectifier tube) AC-DC receiver housed in a wooden cabinet.

Controls are provided for tuning and volume. Other features include the built-in Air Wave Loop Aerial, automatic volume control, beam power audio output stage and a permanent magnet dynamic speaker. The dial scale is calibrated to cover frequencies between 540 and 1600 KC.

ELECTRICAL SPECIFICATIONS

Power Supply.....105-125 volts AC, 25-60 cycles, 35 watts or 105-125 volts DC
Frequency Range.....540-1600 KC
Intermediate Frequency.455 KC
Selectivity.....At 1000 KC, 50 KC wide at 1000 times signal
Sensitivity.....(for .05 watt output with external antenna) 15 microvolts average
Power Output.....1.3 watts maximum
.75 watt 10% distortion
Loud Speaker.....5" PM Dynamic
Voice Coil Impedance...3.2 ohms at 400 cycles

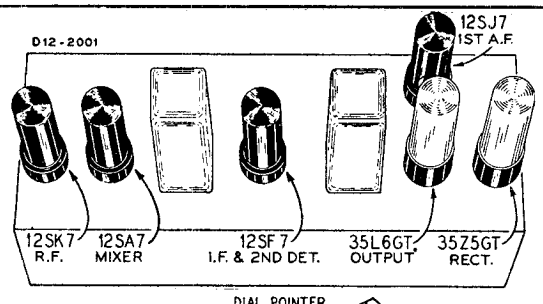
Tube and Dial Light Complement

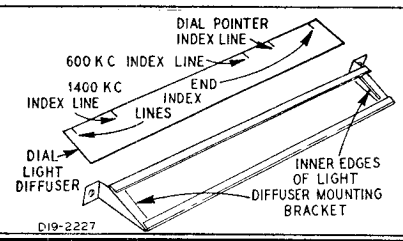
1 12SK7 R-F Amplifier
1 12SA7 Mixer
1 12SF7 I-F and 2nd Detector
1 12SJ7 1st A-F
1 35L6GT Power Output
1 35Z5GT Rectifier
1 47 Dial Lamp

RECEIVER STAGE SENSITIVITIES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of 50 milliwatts. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm 5 watt resistor across the secondary winding of the output transformer. A reading of .4 volt AC across this resistor will be equivalent to a 50 milliwatt output. The volume control must be set to maximum.
The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

SIGNAL GENERATOR				INPUT FOR 50 MILLIWATT OUTPUT
Frequency	Coupling Capacitor	Connection to Receiver	Ground Connection	
1000 kc	200 mmf or RMA Dummy Antenna	Loop Antenna—External antenna clip	Chassis	19.5 microvolts
1000 kc	.05 mf.	12SA7 Mixer—Pin 8	Point "X" (12SK7 Pin 3)	150 microvolts
455 kc	.05 mf	12SA7 Mixer—Pin 8	Same as above	100 microvolts
455 kc	.05 mf	12SF7 I-F—Pin 2	Same as above	3500 microvolts
400 cycles	.05 mf	12SJ7 1st A-F—Pin 4	Same as above	.042 volt
400 cycles	.05 mf	35L6GT Output—Pin 5	Same as above	1 volt





DIAL CALIBRATION

In order to align the receiver, the dial pointer must be positioned on the dial string correctly with reference to the dial. Index lines are provided on the dial light diffuser for this purpose.

Before aligning the receiver (or when replacing the dial light diffuser) check the position of the diffuser strip, making certain that the two end index lines are aligned with the inner edges of the diffuser mounting bracket opening. The bracket should be crimped at one point to prevent movement of the diffuser strip. To position the dial pointer, turn the gang condenser to the fully closed position. The dial pointer should be directly over the dial pointer index line. (See illustration)

The 1400 KC index line is for use when aligning the receiver.

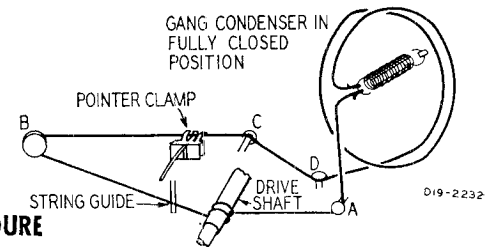
© John F. Rider

MODEL 94WG-1804D

DRIVE CORD REPLACEMENT

Turn the gang condenser to the fully closed position. Use a new 10X44 drive cord assembly and fasten one end to the tension spring. Hook the other end of the tension spring over the tab on the drive pulley. Pass the cord through the slot on the drive pulley rim, under stud A and wind two turns clockwise (from front of chassis) around the tuning shaft. Turns must progress away from chassis. Pass cord over pulley B and stud C under stud D. Pass cord under drive pulley and wind 4 turns counterclockwise around drive pulley Stretch tension spring and fasten free end of cord to spring.

Attach the dial pointer to the cord and position as instructed in paragraph DIAL CALIBRATION.



ALIGNMENT PROCEDURE

Check dial pointer position, see Dial Calibration paragraph.

Volume Control—Maximum All Adjustments.

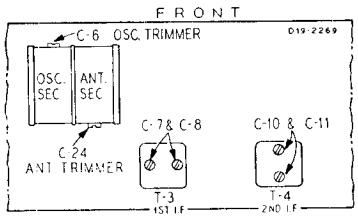
Allow Chassis and Signal Generator to "Heat Up" for several Minutes.

The equipment in column at right is required for aligning:

Signal Generator which will provide an accurately calibrated signal at the test frequencies as listed.

Output Indicating Meter; Non-Metallic Screwdriver.

Dummy Antennas—.1 mf., 50 mmf.



NOTE A:—Index line is on dial light diffuser strip. See DIAL CALIBRATION paragraph.

TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages except those for the heater and dial lamp are between the socket terminal and "X" point.

The readings were taken with a 1000 ohm-per-volt meter and all plate and screen voltages read on a 500 volt scale. Conditions of measurement are:

Line voltage.....117 volts AC
Volume control.....maximum
Signal input.....none

A variation of ±10% is usually permissible.

© John F. Rider

MODEL 94WG-2742A

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

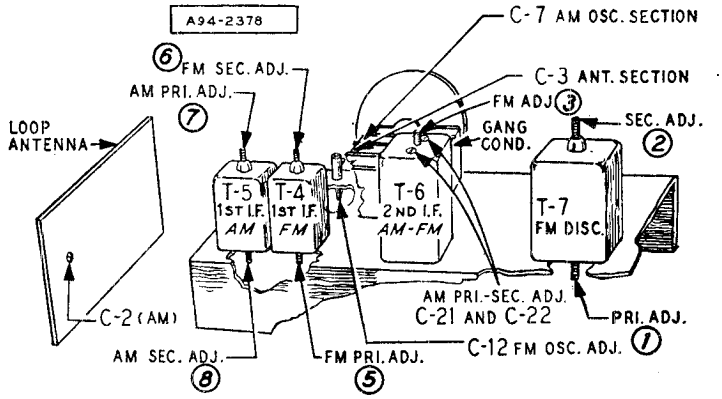
SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	10 Microvolts
1000 KC	.01 mf	6BA7 Converter Pin 7	Chassis	40 Microvolts
455 KC	.01 mf	6BA7 Converter Pin 7	Chassis	35 Microvolts
455 KC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2000 Microvolts
400 cycles	.01 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.01 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

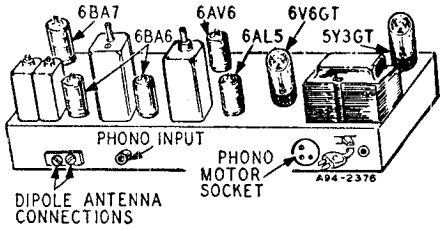
FM STAGES

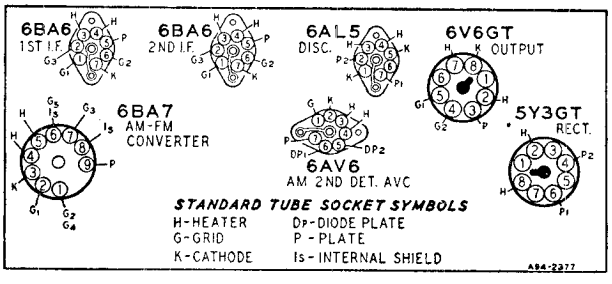
The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 MC	300 ohms	External Antenna Terminal	Chassis	100 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	600 Microvolts
10.7 MC	2500 mmf	6BA6 2nd I-F Pin 1	Chassis	23,000 Microvolts







TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. C-21 and C-22	Maximum Output
455 KC	Control Grid 6BA7 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BA7 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-7	Maximum Output
1400 KC	External Antenna Lead	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-2	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms and a 3300 ohm .5 watt resistor with short leads.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter.

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I-F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

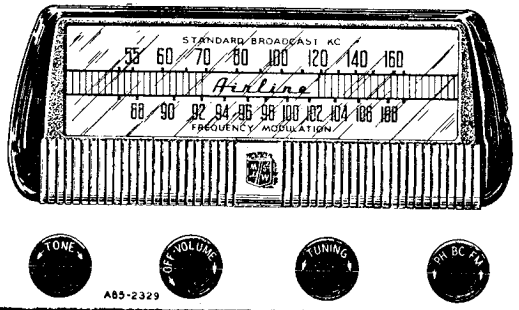
DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.



Issue "D" chassis differ from the issue "C" chassis by a change in value of Condenser C-6 from 12 uuf to 15 uuf, the addition of Condenser C-40 and chokes L-5 and L-6.

MODELS 94WG-2742C, 94WG-2742D

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

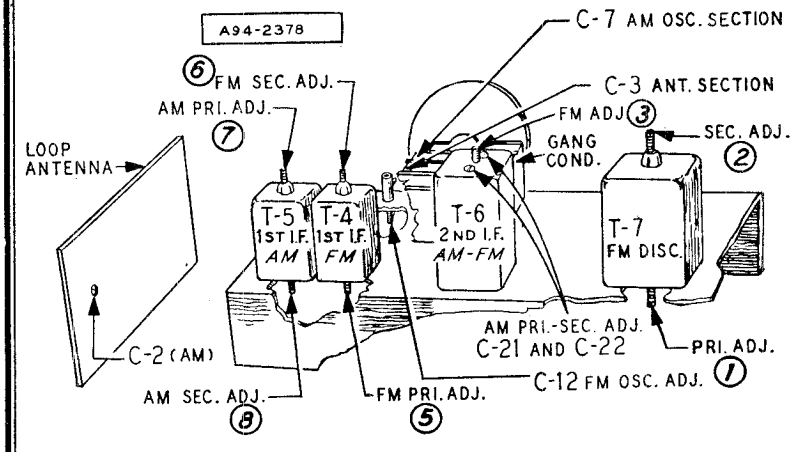
SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Lead	Chassis	10 Microvolts
1000 KC	.01 mf	6BA7 Converter Pin 7	Chassis	40 Microvolts
455 KC	.01 mf	6BA7 Converter Pin 7	Chassis	35 Microvolts
455 KC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2000 Microvolts
400 cycles	.01 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.01 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

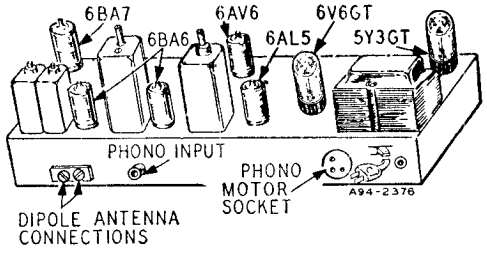
FM STAGES

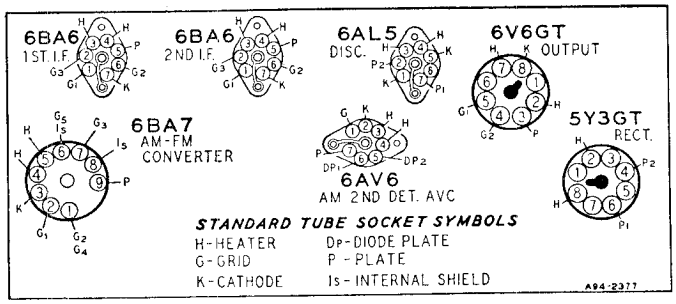
The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 MC	300 ohms	External Antenna Terminal	Chassis	100 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	600 Microvolts
10.7 MC	2500 mmf	6BA6 2nd I-F Pin 1	Chassis	23,000 Microvolts







TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.

RECHECK ANTENNA & OSC. ADJUSTMENTS IN ORDER GIVEN							

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I-F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

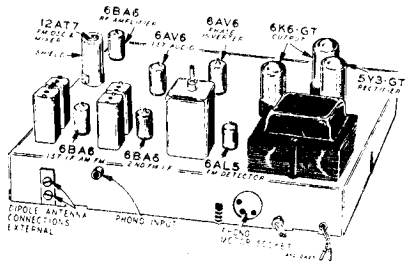
MODEL 94WG-2745A

GENERAL DESCRIPTION

This is a two band, nine tube (plus rectifier tube) AM and FM receiver with automatic record changer. The I-F stages use high gain miniature type tubes. Built-in Air Wave Aerials are provided for the FM and Broadcast bands. Features include, compensator circuits to prevent oscillator drift, automatic volume control, push-pull pentode power output stage, PM dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.

The receiver and record changer are housed in a console combination cabinet with controls provided for tuning, volume, tone and band or phono selection.



ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts AC 60 cycles, 80 watts, 100 watts with record changer
Frequency Ranges	Broadcast 540-1600 KC Frequency Modulation 88-108 MC
Intermediate Frequency	AM—455 KC FM—10.7 MC
Selectivity	AM—43 KC broad at 1000 times signal, measured at 1000 KC I.F. FM—200 KC broad at 2 times down I.F. FM—760 KC broad at 200 times down
AM Sensitivity	(For .5 watt output with external antenna) 10 microvolts average
FM Sensitivity	(For .5 watt output) 30 microvolts average
Power Output	8.5 watts maximum 6.0 watts 10% distortion
Loud Speaker	12" PM Dynamic
Voice Coil Impedance	3.2 ohms 400 cycles
Record Changer	See Manual No. 5081A

1. Condenser C-12 (5000 MMF) not used.

2. The 5000 MMF condenser C-13 is connected to ground instead of as shown in the circuit diagram.

3. The circuit connections of transformers T-1 (1st FM I-F) and T-4 (2nd AM I-F) are shown erroneously in the circuit diagram. The corrected circuit connections are shown below.

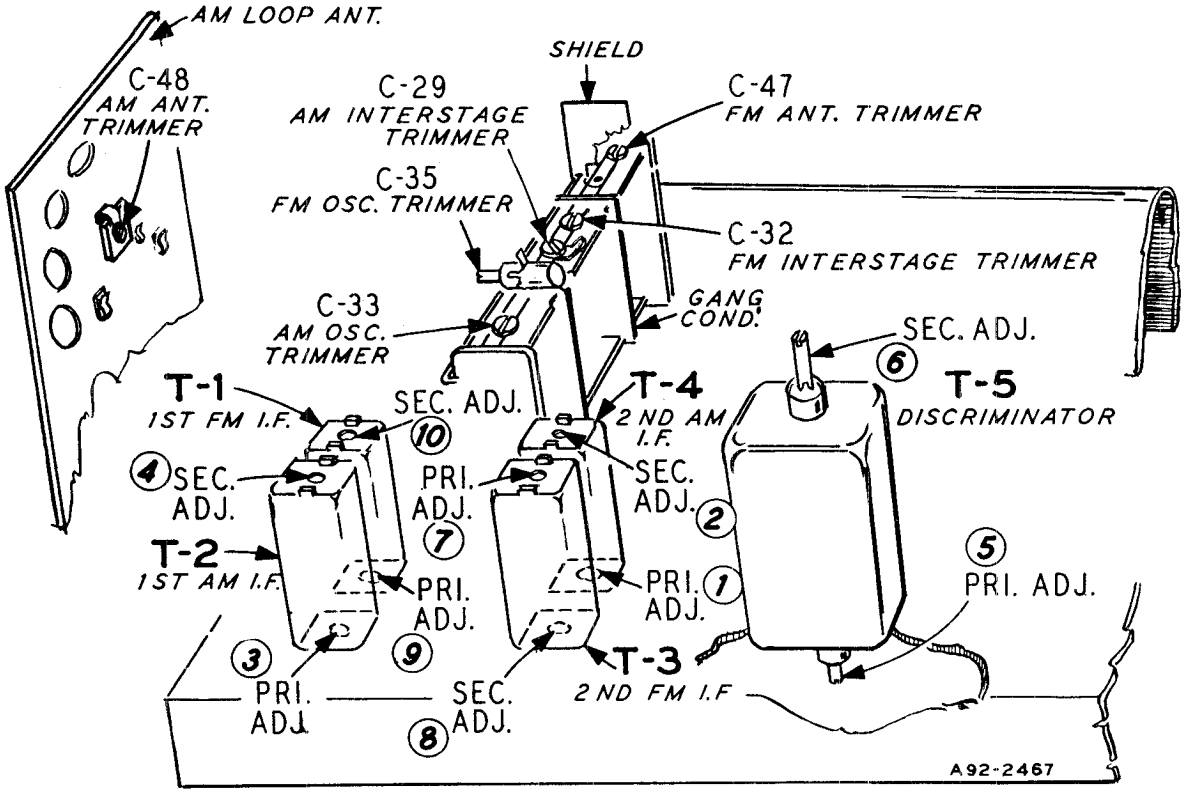
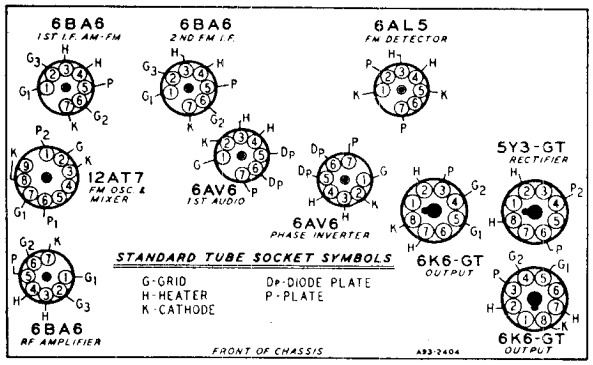
MODEL 94WG-2745A

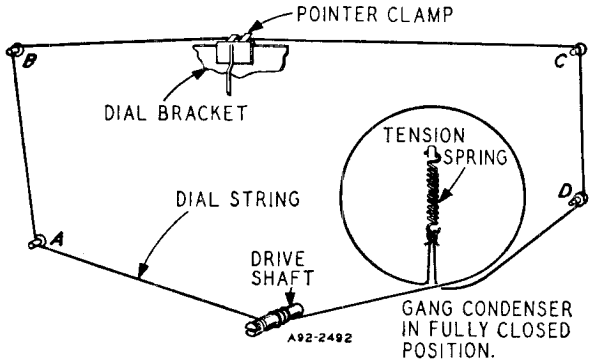


TUBE SOCKET VOLTAGES

Socket voltages are shown on the Schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage .....117 Volts AC
Signal Input .....None
A variation of ±10% is usually permissible.





DRIVE CORD REPLACEMENT

Use a new 10X54 drive cord assembly or a new length of cord 48 inches long for the installation, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation, rotate the drive shaft a few turns to take up the slack in the cord.

MODEL 94WG-2745A

ALIGNMENT PROCEDURE

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas —.1 mf, 200 mmf.
Volume Control—Maximum all Adjustments
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR							
	FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	BAND SWITCH SETTING	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
I-F	455 kc	12AT7 Pin 7 and Chassis	.1 mf	Broadcast	Rotor Fully Open	2nd I-F Pri. & Sec. (1) & (2) 1st I-F Pri. & Sec. (3) & (4)

	1400 kc	External ant. lead	200 mmf	Broadcast	Turn Rotor to Max. Output	Broadcast Interstage C-29	
	1400 kc	External ant. lead	200 mmf	Broadcast	Set pointer to 1400 kc See Note A	Loop Antenna C-48	

Note A—If the pointer is not at 1400 KC on dial, reset pointer at the 1400 KC mark on the dial scale.

FM STAGES

The following equipment is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—.01 mf, 300 ohms and 1000 ohms.
Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings.)
Allow chassis and signal generator to warm up for several minutes.

	104.5	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Tune Rotor for Max. AVC voltage	FM Interstage C-32	Maximum Deflection
	104.5	Disconnect dipole and connect generator to dipole terminals with resistor in series	300 ohms	FM	Tune Rotor for Max. AVC voltage	Ant. C-47	Maximum Deflection

NOTE A—Test Equipment connections are as given in the table. The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line at the junction of resistor R-22 and condenser C-18 for all adjustments except the discriminator secondary adjustment, for which See Note C.

NOTE B—A signal of .1 volt must be fed into the receiver for this adjustment.

NOTE C—Disconnect zero center DC vacuum tube voltmeter from AVC and connect to junction of R-18 and C-62. Adjust for zero voltage indication.

NOTE D—Before adjusting Pri. core connect 1000 ohm load resistor across the 2nd I.F. secondary terminals. Input may have to be increased to .1 volt if receiver is *badly* mis-aligned.

NOTE E—Disconnect 1000 ohm load resistor from secondary terminals and connect across the 2nd I.F. primary terminals. Input may have to be increased to .1 volt if receiver is *badly* mis-aligned.

NOTE F—Input can be reduced to 10,000 microvolts.

NOTE G—Oscillator frequency above signal frequency.

NOTE H—Remove the 1000 ohm load resistor before attempting to check the R-F and oscillator adjustments.

GENERAL DESCRIPTION

This is a two band, six tube (plus rectifier tube) AM and FM receiver with automatic record changer. The I-F stages use high gain miniature type tubes. Built-in Air Wave Aerials are provided for the FM and Broadcast bands. Features include, compensator circuits to prevent oscillator drift, automatic volume control, beam power output stage, PM dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.

The receiver and record changer are housed in a console combination cabinet with controls provided for tuning, volume, tone and band or phono selection.

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts AC 60 cycles, 60 watts. 70 watts with record changer
Frequency Ranges	Broadcast 540-1600 KC Frequency Modulation 88-108 MC
Intermediate Frequency	AM—455KC FM—10.7 MC
Selectivity	AM—45 KC broad at 1000 times signal, measured at 1000 KC I.F. FM—200 KC broad at 2 times down I.F. FM—950 KC broad at 200 times down
AM Sensitivity	(For .5 watt output with external antenna) 10 microvolts average
FM Sensitivity	(For .5 watt output) 100 microvolts average
Power Output	4.5 watts maximum 2.5 watts 10% distortion
Loud Speaker	8" PM Dynamic
Voice Coil Impedance	3.2 ohms 400 cycles
Record Changer	See Manual No. 5077A

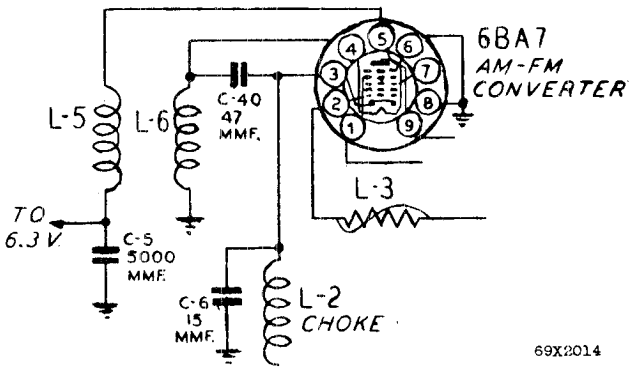
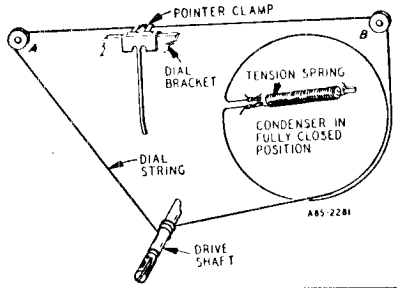
The circuit connections of the condenser and chokes are shown in the partial schematic below.





DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

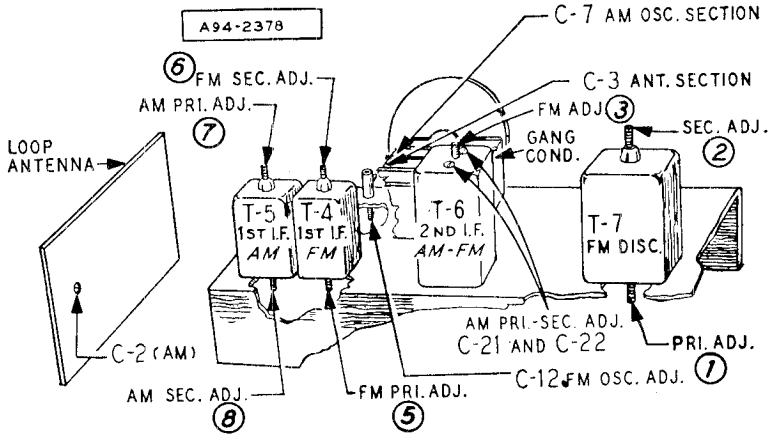
SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Clip	Chassis	10 Microvolts
1000 KC	.01 mf	6BA7 Converter Pin 7	Chassis	40 Microvolts
455 KC	.01 mf	6BA7 Converter Pin 7	Chassis	35 Microvolts
455 KC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2000 Microvolts
400 cycles	.01 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.01 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

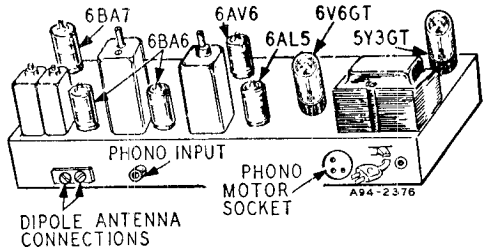
FM STAGES

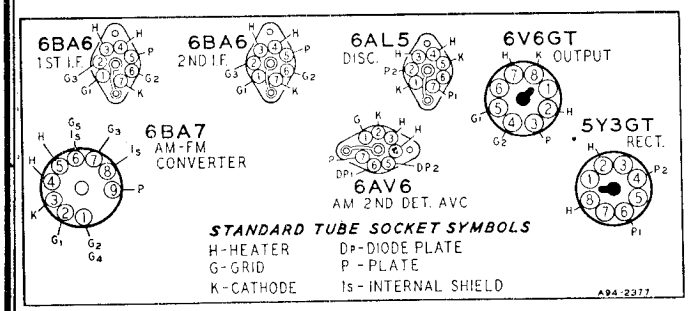
The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				INPUT FOR .5 WATT OUTPUT
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	
98 MC	300 ohms	External Antenna Terminal	Chassis	100 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	600 Microvolts
10.7 MC	2500 mmf	6BA6 2nd I-F Pin 1	Chassis	23,000 Microvolts







TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.

94WG-2746B

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.
Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR						
FREQUENCY SETTING	CONNECT GENERATOR OUTPUT TO	THROUGH DUMMY ANTENNA	CONNECT GROUND TO	GANG CONDENSER SETTING	ADJUST	ADJUST FOR
455 KC	Control Grid 1st 6BA6 Pin No. 1	.1 mf	Chassis Base	Rotor Fully Open	2nd I.F. C-21 and C-22	Maximum Output
455 KC	Control Grid 6BA7 Pin No. 7 1st Det.	.1 mf	Chassis Base	Rotor Fully Open	1st I.F. Pri. and Sec. (7) and (8)	Maximum Output
1620 KC	Control Grid 6BA7 Pin No. 7	.1 mf	Chassis Base	Rotor Fully Open	Oscillator C-7	Maximum Output
1400 KC	External Antenna Clip	50 mmf	Chassis Base	Turn Rotor to Max. Output. Set Pointer to 1400 KC See Note A	Antenna C-2	Maximum Output

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms and a 3300 ohm .5 watt resistor with short leads.
Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

Loud Speaker	8" PM Dynamic
Voice Coil Impedance	3.2 ohms 400 cycles

DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X66 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.

MODEL 94WG-2747A

RECEIVER STAGE SENSITIVITIES

AM AND AUDIO STAGES

The table below lists the sensitivity at the input of each stage. The receiver should be tuned to 1000 KC for all readings. All measurements are based on an output of .5 watt. This may be measured by disconnecting the speaker voice coil and substituting a 3.2 ohm, 5 watt resistor across the secondary winding of the output transformer. A reading of 1.26 volts across this resistor will be equivalent to a .5 watt output.

The volume control must be set to maximum.

The signal source must be an accurately calibrated signal generator capable of supplying both 1000 KC and 455 KC signals modulated 30% with a 400 cycle audio signal. Variations in sensitivity of Plus or Minus 25% are usually permissible.

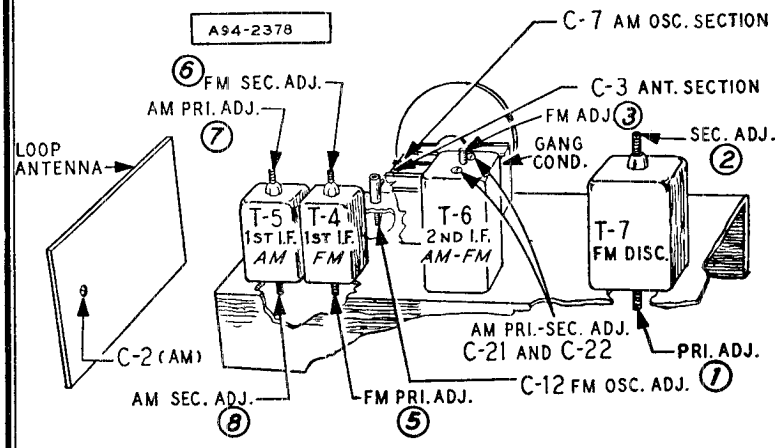
SIGNAL GENERATOR				
FREQUENCY	COUPLING CAPACITOR	CONNECTION TO RECEIVER	GROUND CONNECTION	INPUT FOR .5 WATT OUTPUT
1000 KC	200 mmf or RMA Dummy Antenna	External Antenna Clip	Chassis	10 Microvolts
1000 KC	.01 mf	6BA7 Converter Pin 7	Chassis	40 Microvolts
455 KC	.01 mf	6BA7 Converter Pin 7	Chassis	35 Microvolts
455 KC	.01 mf	6BA6 1st I-F Pin 1	Chassis	2000 Microvolts
400 cycles	.01 mf	6AV6 1st A-F Pin 1	Chassis	.07 Volt
400 cycles	.01 mf	6V6GT Output Pin 5	Chassis	3.2 Volts

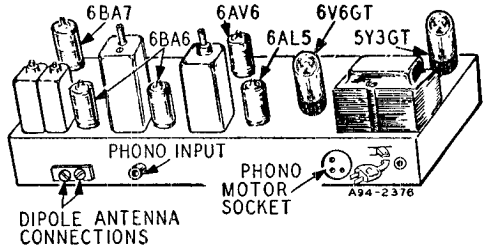
FM STAGES

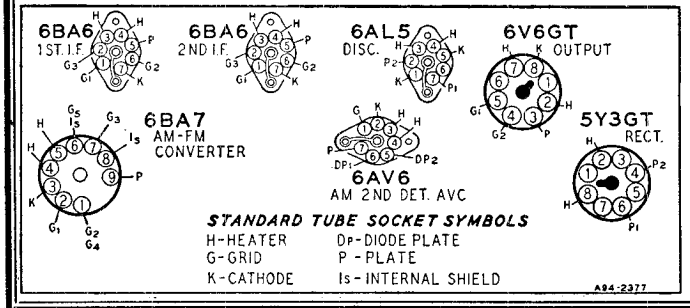
The table below lists the sensitivity for the FM stages of the receiver. The receiver must be tuned to 98 MC for all readings. Measurements are based on a .5 watt output the same as for the AM and Audio stage measurements.

The signal source must be an accurately calibrated signal generator capable of supplying a 98 MC signal modulated by a 400 cycle audio signal. For these measurements the generator must be adjusted for a 22.5 KC deviation. This will correspond to 30% AM modulation.

SIGNAL GENERATOR				
FREQUENCY	COUPLING TO RECEIVER	CONNECTION TO RECEIVER	GROUND CONNECTION	INPUT FOR .5 WATT OUTPUT
98 MC	300 ohms	External Antenna Terminal	Chassis	100 Microvolts
10.7 MC	.01 mf	6BA6 1st I-F Pin 1	Chassis	600 Microvolts
10.7 MC	2500 mmf	6BA6 2nd I-F Pin 1	Chassis	23,000 Microvolts







TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC

Signal Input.....None

A variation of ±10% is usually permissible.

MODEL 94WG-2747A

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR

FM STAGES

The following is required for aligning:
An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.
Non-metallic screwdriver.
Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms and a 3300 ohm .5 watt resistor with short leads.

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

FM ALIGNMENT NOTES

NOTE A—The zero center scale DC vacuum tube voltmeter is to be connected between chassis ground and the AVC line. A signal of .1 volt must be fed into the receiver for this adjustment.
Note output voltage on the zero center DC vacuum tube voltmeter

NOTE B—Disconnect zero center DC vacuum tube voltmeter from AVC and connect it at the audio takeoff point at the 27 K ohm resistor (R-11) and its junction with the terminal strip. Adjust for zero voltage indication.

NOTE C—Connect zero center DC vacuum tube voltmeter as in Note A. Adjust input to give same output on the zero center DC vacuum tube voltmeter as in Note A.

NOTE D—Unsolder 3300 ohm resistor from terminals 3 and 4 of 1st I-F transformer and resolder across terminals 1 and 2.

NOTE E—2nd I-F trimmers (AM) must be aligned before attempting to adjust 2nd I-F (FM) tuning slug.

NOTE F—Remove the 3300 ohm load resistor before attempting to check the antenna and oscillator adjustments.

GENERAL DESCRIPTION

This is a two band, seven tube (plus rectifier tube) AM and FM receiver with automatic record changer. The I-F stages use high gain miniature type tubes. Built-in Air Wave Aerials are provided for the FM and Broadcast bands. Features include, a grounded grid R-F amplifier stage on the FM band, compensator circuits to prevent oscillator drift, automatic volume control, beam power output stage, PM dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.

The receiver and record changer are housed in a console combination cabinet with controls provided for tuning, volume, tone and band or phono selection.

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts AC 60 cycles, 40 watts. 60 watts with record changer
Frequency Ranges	Broadcast 540-1600 KC Frequency Modulation 88-108 MC

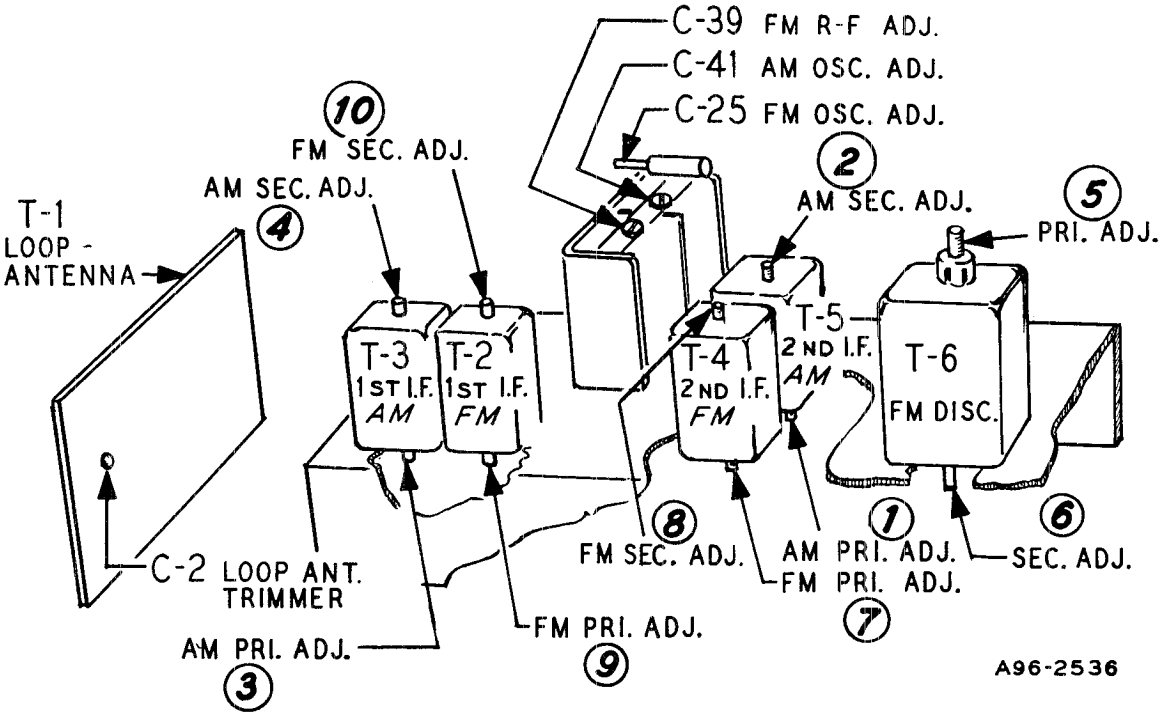
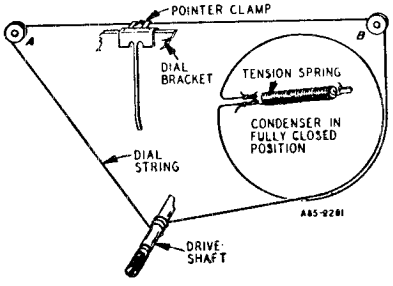
MODEL 94WG-2748A



DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X56 drive cord assembly or a new length of cord 46 inches long for the installation. Install the cord as shown in the illustration, winding three turns clockwise around the drive shatt with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.



TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

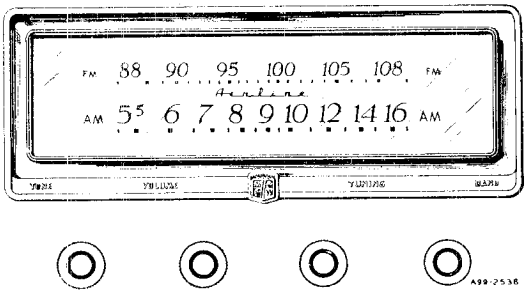
MODEL 94WG-2749A



GENERAL DESCRIPTION

This is a two band, seven tube (plus rectifier tube) AM and FM receiver with automatic record changer. The I-F stages use high gain miniature type tubes. Built-in Air Wave Aerials are provided for the FM and Broadcast bands. Features include, a grounded grid R-F amplifier stage on the FM band, compensator circuits to prevent oscillator drift, automatic volume control, beam power output stage, PM dynamic loud speaker and an electrostatic shield in the power transformer to reduce power line noise.

The receiver and record changer are housed in a console combination cabinet with controls provided for tuning, volume, tone and band or phono selection.

ELECTRICAL SPECIFICATIONS

Power Supply	105-125 volts AC 60 cycles, 60 watts. 80 watts with record changer
Frequency Ranges	Broadcast 540-1600 KC Frequency Modulation 88-108 MC
Intermediate Frequency	AM—455KC FM—10.7 MC
Selectivity	AM—45 KC broad at 1000 times signal, measured at 1000 KC I.F. FM—200 KC broad at 2 times down I.F. FM—950 KC broad at 200 times down
AM Sensitivity	(For .5 watt output with external antenna) 10 microvolts average
FM Sensitivity	(For .5 watt output) 25 microvolts average
Power Output	4.5 watts maximum 2.5 watts 10% distortion
Loud Speaker	12" PM Dynamic
Voice Coil Impedance	3.2 ohms 400 cycles
Record Changer	See Manual No. 5081A

ALIGNMENT PROCEDURES

AM STAGES

The following is required for aligning:
An All Wave Signal Generator Which Will Provide an Accurately Calibrated Signal at the Test Frequencies as Listed.
Output Indicating Meter, Non-Metallic Screwdriver, Dummy Antennas — .1 mf, and 50mmf.

Volume Control Maximum all Adjustments.
Connect Radio Chassis to Ground Post of Signal Generator with a Short Heavy Lead.
Allow Chassis and Signal Generator to "Heat Up" for Several Minutes.

SIGNAL GENERATOR

NOTE A—If the pointer is not at 1400 KC on the dial, reset pointer to the 1400 KC mark on the dial scale.

FM STAGES

The following is required for aligning:

An accurately calibrated signal generator providing unmodulated signals at the test frequencies listed below.

Non-metallic screwdriver.

Dummy Antennas and I-F Loading Resistor—2500 mmf, 300 ohms

Zero center scale DC vacuum tube voltmeter having a range of approximately 3 volts.
(If a zero center scale meter is not available, a standard scale vacuum tube voltmeter may be used by reversing the meter connections for negative readings).
Allow chassis and signal generator to "Heat Up" for several minutes.

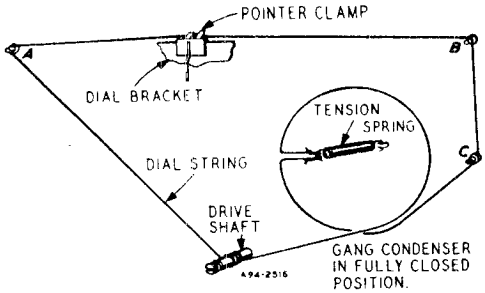
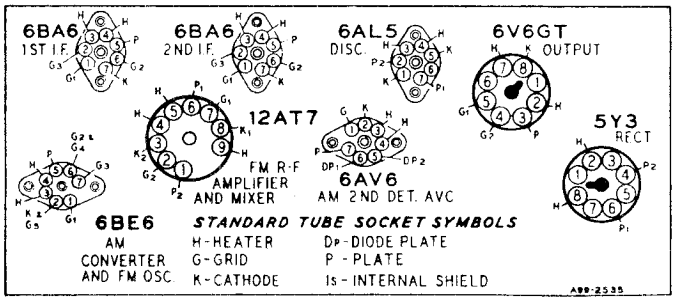
DRIVE CORD REPLACEMENT

DIAL POINTER CORD

Use a new 10X38 drive cord assembly or a new length of cord 48 inches long for the installation. Install the cord as shown in the illustrotion, winding three turns clockwise around the drive shaft with the turns progressing away from the chassis. After completing the installation rotate the drive shaft a few turns to take up the slack in the cord.





TUBE SOCKET VOLTAGES

Socket voltages are shown on the schematic diagram at the tube socket terminals. All voltages are between the socket terminal and chassis ground. Plate, screen and cathode voltages were taken with a 1000 ohm-per-volt meter with a 300 volt scale used for plate and screen voltages. Audio grid voltages were read with a vacuum tube volt-meter. Conditions of measurement are:

Line voltage.....117 Volts AC
Signal Input.....None

A variation of ±10% is usually permissible.

REPLACEMENT PARTS LIST

HOW TO ORDER PARTS—Should it be necessary to write us or to order any repair parts, it is important that the complete model number which appears on the label attached to the rear of the chassis be specified. Repair parts should be ordered from your nearest Wards Retail Store, Catalog Order office or Mail Order House.

MODEL CT9, 1949
Chevrolet

GENERAL INFORMATION

TYPE - Automotive type superheterodyne receiver specifically designed to fit 1949 Chevrolet. Receiver consists of two units; the RF tuner and the Power & Audio Unit.

TUNING RANGE - 535 to 1600 Kc

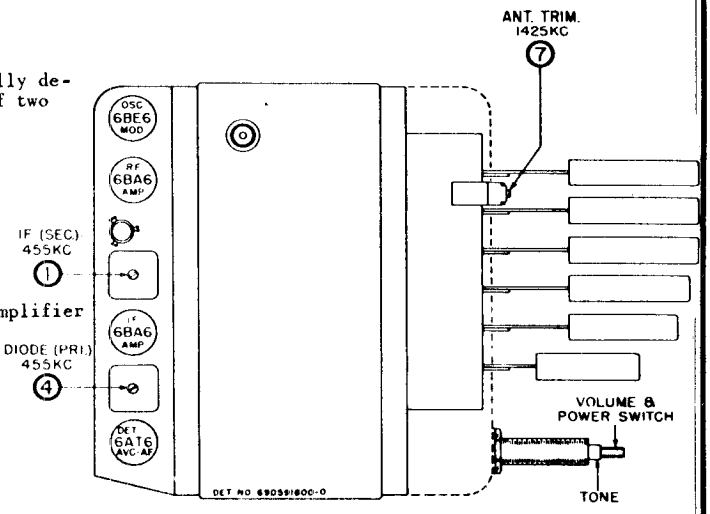
IF - 455 Kc

TUBE COMPLEMENT - 6BA6 - RF Amplifier
6BE6 - Oscillator-Modulator
6BA6 - IF Amplifier
6AT6 - Diode detector, AVC & 1st AF Amplifier
6V6GT- Power Amplifier
6X4 - Rectifier

POWER INPUT - 6.8 amps at 6.3V DC

POWER OUTPUT - 3 watts (max)

PUSH BUTTON TUNER - Automatic Tuner AT-71.



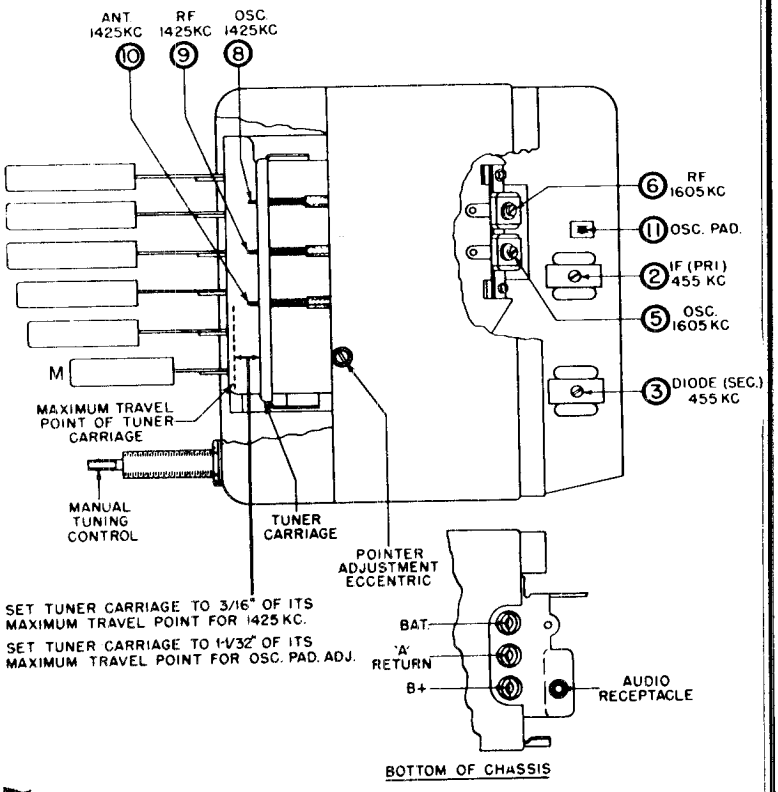
TO SET THE PUSH BUTTONS

1. Turn the radio ON and allow it to warm up for a few minutes.

2. Push the top button in as far as it will go and HOLD IT THAT WAY.

3. With the tuning knob, tune in the station you desire to set up. Tune carefully until you are exactly on the station; tuning to either side of it will result in poor tone quality. Release button and knob after tuning-in the station.

4. Follow above steps 2 and 3 for the remaining four buttons.



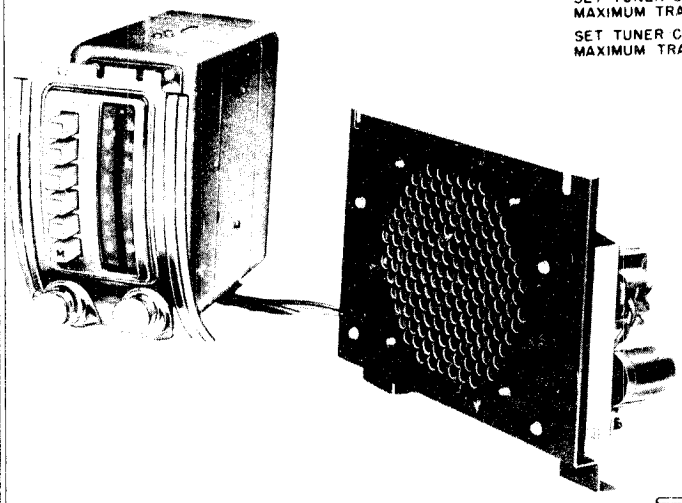


FIGURE 1. TUBE & TRIMMER LOCATION

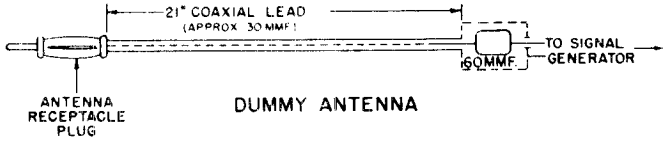

DUMMY ANTENNA

MODEL CT9, 1949
Chevrolet

ALIGNMENT

EQUIPMENT REQUIRED

1. A special tool for adjusting the tuner cores. Use Alignment Tool, Motorola Part No. 66A76278.

2. A small screwdriver for IF & RF alignment.

3. An accurately calibrated AM modulated signal generator.

4. A low range output meter.

5. A special dummy antenna for RF alignment. Construct dummy antenna as shown in Figure 1. The 21" coaxial lead needed in its construction is the same type as used for lead-in on Motorola car antennas.

PROCEDURE

1. Expose the alignment screws as follows: remove escutcheon, dial background and rear cover.

2. Connect the power & audio unit to the tuner unit and connect the output meter across the voice coil.

3. Connect a 6 volt storage battery to the power & audio unit chassis and 'A' lead. Turn on the receiver and allow it to warm up a few minutes. Set the receiver volume control at maximum and the tone control on 'high'.

4. For greatest accuracy, keep the output of the receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.

5. IF & RF ALIGNMENT - See Alignment Chart & Fig. 1
IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores. The slightest inward pressure on the alignment tool may move the tuner carriage and result in inaccurate alignment.

6. ANTENNA TRIMMER ADJUSTMENT. Once alignment has been satisfactorily performed, no further adjustment of any alignment screws should be made except to align the antenna trimmer (7) to the antenna after receiver is installed in car. This adjustment should be made with the antenna fully extended and receiver set to approximately 1400 Kc. Peak the trimmer for maximum volume of a weak station or background noise between stations. Trimmer can be reached from front by removing the top push button.

7. POINTER ADJUSTMENT. The pointer can be moved slightly for calibration correction by turning the eccentric adjustment rivet. This rivet has a slotted head and is exposed only when tuner is tuned to high frequency end. See Figure 1 for its location.

ALIGNMENT CHART

STEP	TUNER SET TO	DUMMY ANTENNA	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR FREQUENCY	ADJUST	REMARKS
1.	High frequency end (cores out)	.1 mf	Hi side -6BE6 grid (pin #7) Lo side -chassis.	455 Kc	1, 2, 3 & 4	Peak for maximum in order indicated. Check by repeating procedure.
2.	High frequency end; Core screws should project 5/16" from core adjustment clip	Special -See Fig. 1	Ant. receptacle through special dummy.	1605 Kc	5, 6, & 7	Peak for maximum in order indicated.
3.	Using manual knob, set tuner to extreme HF position, then move carriage inward 3/16" (see 'Measurements', Fig. 1)	Special -See Fig. 1	Ant. receptacle through special dummy.	1425 Kc	8, 9 & 10	Peak for max. in order indicated.
4.	Move carriage 1-1/32" inward from point of maximum travel	Special -See Fig. 1	Ant. receptacle through special dummy.	Turn generator power off.	11	Peak oscillator padder for maximum noise. See*
5.	Approx. 1400 Kc	-	-	-	7	With set installed in car, peak antenna trimmer for maximum noise or volume of a weak station. Car antenna should be fully extended.

* If padder core (11) must be moved more than 1/2 turn from its original position, repeat steps 2, 3 & 4 until it is necessary to move the padder core less than 1/2 turn in this step.

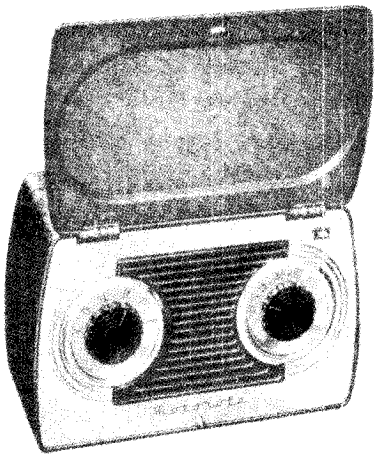
MODELS 5A9B, 5A9M, 5A9S,
Ch.HS-62A; 5A9UB, 5A9UM, Ch. HS-165

GENERAL INFORMATION



TYPE - Three-power (AC/DC-Battery) portable radio receiver of the personal type. Four miniature type tubes and a selenium rectifier are used in a superheterodyne circuit.

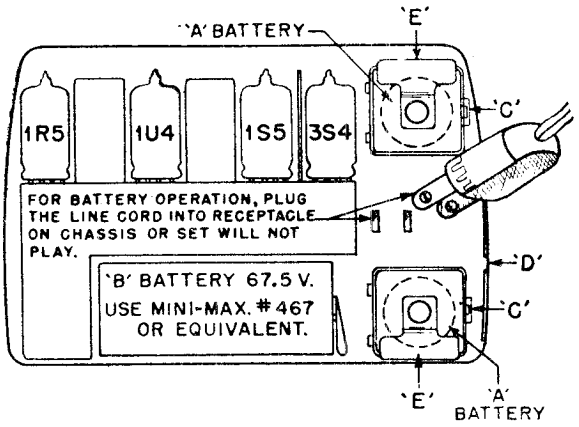
Model 5A9B - black crackle finish; uses chassis HS-62A
Model 5A9M - maroon crackle finish; uses chassis HS-62A
Model 5A9S - black crackle finish; uses chassis HS-62A
Model 5A9UB - black crackle finish; uses chassis HS-165
Model 5A9UM - maroon crackle finish; uses chassis HS-165

TUNING RANGE - 535 to 1620 Kc IF - 455 Kc

TUBE COMPLEMENT - 1R5 - Oscillator-Modulator
1U4 - IF Amplifier
1S5 - Detector, AVC & 1st AF Amplifier
3S4 - Power Amplifier
Rectifier - Selenium type - for AC/DC operation

POWER SUPPLY - Operates from 117V AC/DC (15 watts) or from the following batteries:

2 - 1-1/2V flashlight cells (Eveready #950 or equivalent)
1 - 67-1/2 "B" battery (Eveready #467 or equivalent)



'A' Batteries: 1½ V. flashlight cells. Use Eveready No. 950 or equiv. Install with Center Terminal facing back of set. 2 used.

To open 'A' Battery Compartments push Catches 'C' to the right.

When playing from house current, pass Line Cord through Slot 'D' in cabinet.

When line cord is not in use, wind it around Cord Clamps 'E'.

FIGURE 1. BATTERY INSTALLATION DETAIL

ALIGNMENT

It is recommended that receiver be operated from battery during alignment.

If AC power is used, place an isolation transformer between power line and receiver. Connect low side of generator to B-.

A low range output meter should be connected to the speaker voice coil terminal and receiver chassis. Set receiver volume control to maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	GANG SET TO	ADJUST	REMARKS
IF ALIGNMENT						
1.	.1 mf	See Fig. 2.	455 Kc	Gang opened	1, 2 & 3	Adjust for maximum.
RF ALIGNMENT						
2.	.1 mf	See Fig. 2.	1620 Kc	Gang opened	4	This sets oscillator to dial scale.
3.	-	-	-	-	-	Install chassis in cabinet, leaving output meter connected to speaker.
4.	-	Radiation loop*	1400 Kc	Tune for maximum	5	Adjust for maximum. Trimmer is reached through hole under plug button on side of cabinet.

SWITCHES		
S-1	40A470619	Slide switch: 5PDT (AC-DC/Battery selector-interchangeable with 40B471927)
or	40B471927	Rotary Change-over Switch: 5PDT (AC-DC Battery Selector- interchangeable with 40A470619)
S-2	40A470937	Slide Switch (on-off)
TRANSFORMERS		
T-1	24B480042 or 24B690840	IF, 455 Kc: complete with padding capacitors and tuning cores; less shield
T-2	24B480040	Diode, 455 Kc: complete with padding capacitor and tuning core; less shield
T-3	25B470622	Output
CHASSIS PARTS - MECHANICAL		
1	1X470935	Battery Box and Bracket Assembly: two complete 'A' battery boxes assembled together; includes negative contacts and positive contact insulator catches only
2	7A478012	Bracket, speaker mounting (used only with 50B478023 speaker)
3	1X470835	Bushing and Insulator Assembly (chassis insulated mtg)
4	43K13458	Bushing, plain: brass (used inside sub-chassis shock mtg grommets)
5	55A470913	Catch, battery insulator: phosphor bronze
6	30B470621	Cord, line and plug: 2-conductor, 6 ft lg (HS-62A)
or	30K680022	Cord, line and plug: 2-conductor; 5 ft lg (HS-165)
7	46K680318	Core, iron: threaded (IF & diode trans tuning)
8	15C470942	Cover, chassis (bottom chassis cover)
9	5K470916	Grommet, insulating: rubber (sub-chassis shock mtg)
10	1X470933	Insulator, Lead and Lug Assembly. includes cord clamp ('A' battery box positive contact)
11	14A470614	Insulator, line cord lock: fibre
12	14A478112	Insulator, rectifier: armite
13	1X477026	Insulator, Spring, Lead and Lug Assembly ('A' battery box negative contact)
14	14A470617	Insulator, terminal strip: armite: small
15	14A470615	Insulator, terminal strip: armite large
16	4S7666	Lockwasher, ext: #6 (resistor mtg)
17	4S7650	Lockwasher, int: #6 (term strip and rectifier mtg)
18	29R5235	Lug, soldering: #6
19	29R5239	Lug, soldering: #8 (HS-165 only)
20	2S7005	Nut, hex: 6-32 x 1/4; stl; cad pl (resistor and rectifier mtg)
21	2S7018	Nut, hex: 3/8-32 x 1/2; stl; cad pl (vol cont mtg)
22	9A470980	Receptacle, loop lead
23	5S8497	Rivet: .088 x 1/8; stl; nkl pl (line cord lock mtg and bushing & insulator assembly mtg)
24	5S7769	Rivet: .088 x 3/32; stl; nkl pl (term strip mtg)
25	5S7770	Rivet: .088 x 5/32; stl; nkl pl (line cord lock, battery insulator catch and chassis insulator mtg)
26	5S7771	Rivet: .088 x 3/16; stl; nkl pl (tube socket mtg)
27	5S7706	Rivet: .122 x 1/8; stl; nkl pl (electrolytic strap, ON-OFF switch, terminal strip and battery box & brkt assembly mtg)
28	5S7707	Rivet: .122 x 5/32; stl; nkl pl (spkr screen mtg-HS-165)
29	5S7701	Rivet: .122 x 3/4; stl; nkl pl (term strip mtg)
30	64A680021	Screen, speaker (HS-165)
31	3S7247	Screw, machine: 6-32 x 3/16; slotted hex head locking type; stl; cad pl (gang mtg)
32	3S9663	Screw, machine: 6-32 x 1-1/8; slotted round head; stl; cad pl (rectifier mtg)
33	3S1451	Screw, machine: 6-32 x 2"; slotted round head; stl; cad pl (resistor mtg -HS-62A)
or	3S488195	Screw, machine: 6-32 x 2"; plain round head; stl; cad pl (resistor mtg -HS-165)
34	3S7205	Screw, machine: 8-32 x 1/4 slotted hex head locking type; stl cad pl (spkr mtg)
35	3S2681	Screw, sheet metal: #4 x 3/8; Phillips fillister head thread cutting screw; stl; cad pl (sub-chassis mtg)
36	3S7462	Screw, sheet metal: #6 x 3/16; slotted hex head thread cutting; stl; cad pl (AC/DC Battery sw mtg-center)
37	3S7506	Screw, sheet metal: #6 x 1/4; PKZ plain hex head; stl; cad pl (osc coil and battery box mtg)
38	3S7471	Screw, sheet metal: #6 x 1/4 thread cutting; plain hex head; stl; cad pl (chassis cover mtg-HS-62A)
or	3S7460	Screw, sheet metal: #6 x 1/4; slotted binderhead thread cutting screw; stl; cad pl (chassis cover mtg-HS-165)
39	1K480037	Shield and Sleeve Assembly (for T-1 & T-2)
40	26A470908	Shield, tube
41	9A690129	Socket, tube: miniature; 7-prong
42	42A470607	Strap, electrolytic retainer
43	31K470880	Strip, 'B' battery terminal
44	31A84794	Strip, terminal: 1 insulated lug, end mtg
45	31K86126	Strip, terminal: 2 insulated lugs, #2 mtg (3/8 spacing)
46	31A38311	Strip, terminal: 2 insulated lugs, #2 mtg (1/4" spacing)
47	31A71196	Strip, terminal: 3 insulated lugs, #1 mtg
48	31A470612	Strip, terminal: 5 insulated lugs, hole mtg

49	4A51143	Washer, fibre: 3/8" (resistor mtg)	
50	3S7554	Washer, flat: 3/8 x 1/8 x .033 thick; stl; cad pl (sub-chassis mtg)	
51	4S7555	Washer, flat: 1/4 x .128 x .033 thick; stl; cad pl (spkr screen mtg-HS-165)	

CABINET PARTS

101	36K690047	Button, loop cover: blk plastic (5A9B, 5A9S and 5A9UB)	
	or 36K690473	Button, loop cover: maroon plastic (5A9M & 5A9UM)	
102	38K690080	Button, plug: wrinkle blk finish (cover for loop ant. trim hole -5A9B, 5A9S and 5A9UB)	
	or 38K690472	Button, plug: wrinkle maroon finish (cover for loop ant. trim hole -5A9M and 5A9UM)	
103	1X690061	Cabinet: complete;blk crackle finish; includes housing, rear cover with catch, felt feet and armite housing insulators; does not include carrying handle or front cover and loop (5A9B and 5A9S)	
	or 1X690476	Cabinet: same as above except with maroon crackle finish (5A9M)	
	or 1X690126	Cabinet: same as above except with blk crackle finish (5A9UB)	
	or 1X690482	Cabinet: same as above except with maroon crackle finish (5A9UM)	
104	1X690084	Cover, Loop and Front Panel Assembly: includes satin finished chrome front panel, latch retainer stud, two insulated hinges, blk molded speaker grille, blk loop ant and loop cover with latch (5A9B, 5A9S & 5A9UB)	
	or 1X690477	Cover, Loop and Front Panel Assembly: same as above except maroon finish (5A9M and 5A9UM)	
105	1X690087	Cover and Latch Assembly: blk; loop ant cover with complete latch assembly (5A9B, 5A9S and 5A9UB)	
	or 1X690479	Cover and Latch Assembly: maroon; loop ant cover with complete latch assembly (5A9M & 5A9UM)	
106	55A27113	Foot, felt	
107	13K690051	Grille, speaker: blk plastic (5A9B, 5A9S and 5A9UB)	
	or 13C470873	Grille, speaker: maroon plastic (5A9M and 5A9UM)	
108	55B690068	Handle, carrying: blk; complete (5A9B, 5A9S and 5A9UB)	
	or 55K690113	Handle, carrying: maroon; complete (5A9M and 5A9UM)	
109	55K30198	Hinge, back cover	
110	1X690086	Hinge and Insulator Assembly (front cover hinge)	
111	14D478014	Insulator, inner housing: right-hand; armite	
112	14K478079	Insulator, inner housing: left-hand; armite	
113	36K690050	Knob, control: blk plastic (5A9B, 5A9S and 5A9UB)	
	or 36K690474	Knob, control: maroon plastic (5A9M and 5A9UM)	
114	54B690229	Label, composite: operating instructions & cover insulator (5A9S)	
	or 54B690204	Label, composite: operating instructions & cover insulator (5A9B)	
	or 54B690213	Label, composite: operating instructions & cover insulator (5A9M)	
	or 54B690214	Label, composite: operating instructions & cover insulator (5A9UB)	
	or 54B690215	Label, composite: operating instructions & cover insulator (5A9UM)	
115	4S8406	Lockwasher, int: #2; stl; cad p' (housing ins and loop lug mtg	
116	29R5399	Lug, soldering: #3	
117	15K690052	Panel, front: metal; satin chrome finish (5A9B, 5A9S & 5A9UB)	
	or 15K690471	Panel, front: metal; satin chrome finish (5A9M and 5A9UM)	
118	1X690088	Plate and Latch Assembly	
119	5S7769	Rivet: .088 x 3/32; stl; nkl pl (rear cover hinge mtg)	
120	5S8487	Rivet: .088 x 3/32; stl; blk nkl finish (rear cover catch mtg 5A9B, 5A9S and 5A9UB)	
	or 5S2831	Rivet: .088 x 3/32; stl; statuary bronze finish (rear cover catch mtg -5A9M and 5A9UM)	
121	5S2847	Rivet: .088 x 1/4; stl; blk nkl finish (mounts hinge to front panel-5A9B, 5A9S & 5A9UB)	
	or 5S2829	Rivet: .088 x 1/4; stl; statuary bronze finish (mounts hinge to front panel - 5A9M and 5A9UM)	
122	5S8490	Rivet: .088 x 5/32; stl; blk nkl finish (housing insulator mtg)	
123	5S8490	Rivet: .088 x 5/32; stl; blk nkl finish (mounts hinge to loop panel-5A9B, 5A9S and 5A9UB)	
	or 5S2827	Rivet: .088 x 5/32; stl; statuary bronze finish (mounts hinge to loop panel-5A9M and 5A9UM)	
124	3S490017	Screw, machine: 4-40 x 1/4; Phillips binderhead; blk nkl finish (chassis to cabinet mtg-5A9B, 5A9S and 5A9UB)	
	or 3S476038	Screw, machine: 4-40 x 1/4; Phillips binderhead; statuary bronze finish (chassis to cabinet mtg-5A9M and 5A9UM)	
125	3S490018	Screw, sheet metal: #2 x 1/4; PKZ Phillips flat head; blk nkl finish (mounts loop to loop cover-5A9B, 5A9S & 5A9UB)	
	or 3S3389	Screw, sheet metal: #2 x 1/4; PKZ Phillips flat head; statuary bronze finish (mounts loop to loop cover- 5A9M and 5A9UM)	
126	3S490019	Screw, sheet metal: #4 x 3/16; PKA Phillips stove head; blk nkl finish (mounts front panel to housing-5A9B, 5A9S and 5A9UB)	
	or 3S3390	Screw, sheet metal: #4 x 3/16; PKA Phillips stove head; statuary bronze finish (mounts front panel to housing-5A9M and 5A9UM)	
127	1X690083	Spring and Button Assembly (rear cover catch)	
128	41A470909	Spring, loop door catch	
129	46K690046	Stud, latch retainer	
130	46K690079	Stud, trimount: blk nkl finish(on loop panel for actuating on-off switch-5A9B, 5A9S and 5A9UB)	

SERVICE NOTES

To remove the chassis from the cabinet, remove the two 4-40 screws (one on each side of the cabinet), pull off the tuning knobs, remove the front panel, disconnect the two loop leads from the pin receptacles, and slide the chassis out of the cabinet.

To remove the chassis cover plate, remove the two slotted screws holding the plate to the edge of the large chassis, and with the set lying with speaker cone down, lift the plate up from the chassis.

To remove the gang capacitor, the screws holding the small chassis to the large chassis should be removed. This makes it possible to pull the small chassis strip out of the way so that access can be had to the screws holding the gang.

For access to some of the wiring, the 'A' battery boxes may have to be removed. To do this, remove the two hex-headed screws over the slide switch, leaving the center screw in place. The two boxes and the connecting bracket may now be separated from the chassis. The bottom plates of the battery boxes are wired to the set, but the plates may be removed by bending the ears on the boxes outward.

Placement of the four tubes (1R5, 1U4, 1S5 and 3S4) is such that they may be easily removed for servicing by opening the back cover of the set. To reduce microphonic howl, rubber shock mounting is provided for the small chassis holding the tubes and coils. A thin piece of braid serves to bond the two chassis. This braid, as well as all leads connecting the small chassis wiring to the large chassis, should be carefully dressed and free in movement to insure a good floating action of the small chassis.

Insulation between the cabinet (front, back and wrap-around) and chassis is provided for by the bakelite bushing mountings on the sides and by a wrap of armite riveted to the inside of the cabinet. The speaker is held in place by one screw located in the back of the 1S5 tube and a locating ear under the diode coil can. To replace the speaker, remove the 8-32 hex-headed screw, unsolder the voice coil lead receptacle on the speaker and pull the speaker out from the front of the set.

Turning the set "on" or "off" is accomplished by opening or closing the front cover which actuates a push rod connected to a switch. Overthrow has been provided in the switch so that the switch is open circuited before the cover is completely closed. This prevents tolerance between the cover and front panel from causing switch failure. Inserting the line cord plug into the two slots between the battery boxes operates a slide switch which changes the circuit wiring to battery operation. The oscillator coil and tuning capacitor leads should be dressed close to the chassis. This will minimize shifting of oscillator frequency when chassis is installed in its cabinet.

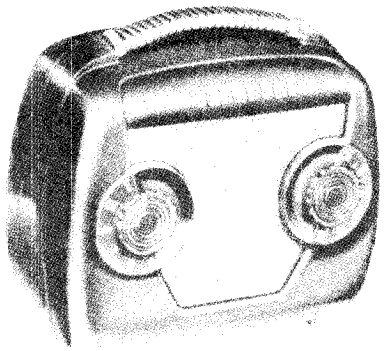
MODELS 49L11Q, 49L13Q;
Ch. HS-183

GENERAL INFORMATION



TYPE - A battery-operated portable receiver. Four miniature type tubes are used in a superheterodyne circuit.

TUNING RANGE - 535 to 1620 Kc IF - 455 Kc

TUBE COMPLEMENT - 1R5 - Converter
1U4 - IF Amplifier
1U5 - Detector, AVC & 1st AF Amplifier
3S4 - Power Amplifier

POWER SUPPLY - Operates from the following batteries:

Two 1-1/2V flashlight cells (Eveready #950 or equivalent)
One 67-1/2V 'B' battery (Eveready #467 or equivalent)

INSTALLATION & OPERATING INSTRUCTIONS

CONTROLS. The power switch is combined and operated with the volume (left-hand) knob.

BATTERY OPERATION. Open the rear cover and install the batteries. The rear cover is opened by inserting the fingertips into the slots under the handle and pulling back. See Figure 1 for complete battery installation instructions.

When low volume or fuzzy tone is noticed, replace the flashlight cells. Normally, the 67-1/2 volt 'B' battery will last for 3 or 4 changes of flashlight cells.

If the receiver is to be placed in storage, remove the batteries and store them in a cool place; this will prevent battery leakage and possible damage to the receiver. Replace or remove run-down batteries immediately, or they will leak and damage receiver.

SERVICE NOTES

Tubes can be replaced without removing the chassis from the cabinet; open the back cover and remove the chassis insulator to expose the tubes. Two plug buttons hold the chassis insulator in position.

To remove the chassis from the cabinet:

1. Remove the control knobs.
2. Open the back cover and remove the chassis insulator.
3. Disconnect the two loop leads from the pin receptacles.
4. Remove the two Phillips head screws on each end of the chassis and slide the chassis out of the cabinet.

ALIGNMENT

Connect a low range output meter across the speaker voice coil terminal and receiver chassis. Set the receiver volume control to maximum. For greatest accuracy keep the output of the receiver at approximately .05 watt (.05 watt = .40 volts on output meter) throughout alignment by reducing generator output as stages are brought into alignment. Use a small fibre screwdriver for aligning the IF and diode transformers.

Loop antenna should be connected to chassis during alignment.

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	DIAL SET TO	ADJUST	REMARKS
IF ALIGNMENT						
1.	.1 mf	Rear stator of tuning capacitor.	455 Kc	Gang opened	1, 2 & 3	Adjust for maximum.
RF ALIGNMENT						
2.	.1 mf	"	1620 Kc	"	4	Adjust for maximum.
3.	-	-	-	-	-	**Install chassis in cabinet, leaving output meter connected to speaker.
4.	-	Radiation loop*	1400 Kc	Tune for maximum	5	Adjust for maximum. Trimmer is reached through hole under left-hand battery holder.

* Connect generator output to a 5" diameter 3 turn loop and couple to receiver loop. Keep loops at least 12" apart.

** As an alternate method, the output meter may be disconnected at this point and the set installed in the cabinet. Tune in a weak station near 1400 Kc and adjust trimmer #5 through the hole in the bottom of the cabinet for maximum signal output.

GENERAL INFORMATION

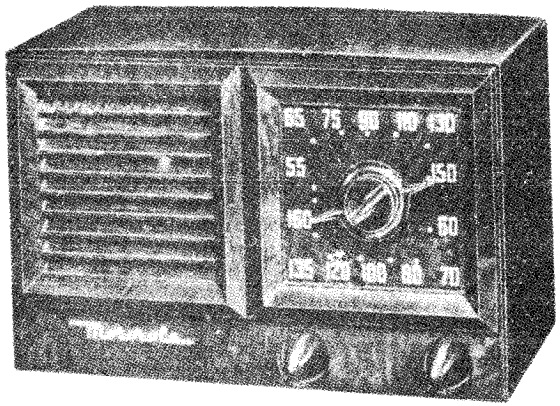
TYPE - AC-DC table model superheterodyne with loop antenna.

TUNING RANGE - 535 to 1620 Kc

IF FREQUENCY - 455 Kc

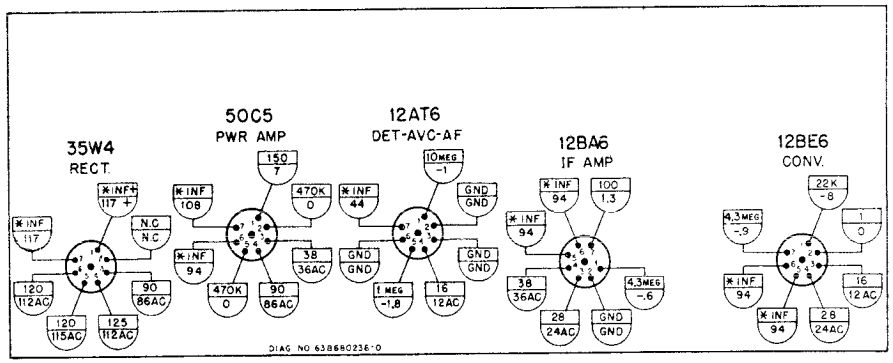
TUBE COMPLEMENT - 12BE6 - Converter
12BA6 - IF Amplifier
12AT6 - Detector, AVC & 1st AF Amp
50C5 - Power Amplifier
35W4 - Rectifier

POWER SUPPLY - 105-125V AC or DC, 30 watts



58G11 Walnut Cabinet 58G12 Ivory Cabinet

CAUTION: Never connect antenna or chassis to water pipe, radiator or other ground. The chassis of this receiver is connected directly to the power line. When operating chassis outside of its cabinet (from an AC power line) use an isolating transformer between power line and receiver to reduce possibility of electrical shock.



NOTE: - ▭ = RESISTANCE MEASUREMENTS.
◡ = VOLTAGE MEASUREMENTS.
\+ = TIE POINT.
GND = GROUND TO CHASSIS.
N.C. = NO CONNECTION.
K = 1000 (ONE THOUSAND) OHMS.

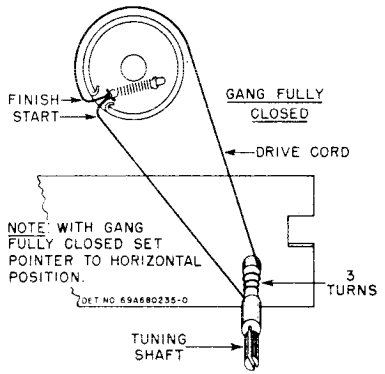

FIGURE 2. DIAL RESTRINGING DETAIL

MODELS 58G11,
58G12; Ch. HS-160

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

A low range output meter should be connected to the speaker voice coil terminal and receiver chassis. Set receiver volume control to maximum. For greatest accuracy, keep output of receiver at .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.

To adjust the IF and diode transformers, use a small fibre screwdriver and do not use undue pressure as damage to the core or coil form may result.

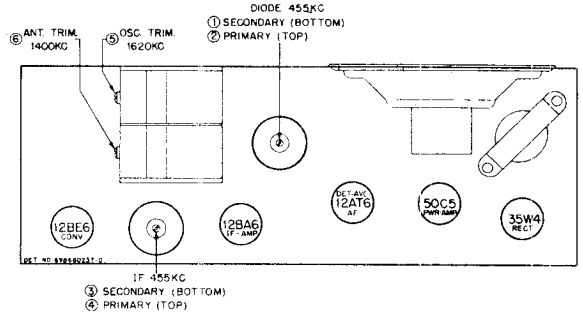

FIGURE 3. TUBE & TRIMMER LOCATIONS

STEP	DIAL SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	Converter Grid & chassis*	455 Kc	1,2,3 & 4	Adjust for maximum.
RF ALIGNMENT						
2.	Gang fully opened	.1 mf	Converter Grid & chassis*	1620 Kc	5	This sets oscillator to dial scale.
3.	1400 Kc	None	Radiation loop**	1400 Kc	6	Tune signal in on receiver, then adjust ant. trimmer (6) for maximum.

* A convenient point for this connection is the stator lug of the loop section of the tuning capacitor.

** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of 50 milliwatts (.40) on output meter. Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

GENERAL INFORMATION

TYPE -AC-DC table model superheterodyne with loop antenna.

TUNING RANGE - 535 to 1620 Kc IF - 455 Kc

TUBE COMPLEMENT - 12BE6 Converter
12BA6 IF Amp
12AT6 Det. AVC & AF Amp
50C5 Power Amp
35W4 Rectifier

POWER SUPPLY - Operates from 117 volts AC or DC, 50 to 60 cycles, 35 watts

POWER SWITCH & VOLUME CONTROL. Operated with small lower knob. NOTE: Reverse the line plug in the electrical outlet if the radio does not operate from DC. When operating from AC, reversing the line cord plug in wall outlet may sometimes improve reception and reduce hum.

TUNING. Tune in station with large upper knob.

ANTENNA. A loop antenna is built into this receiver, eliminating the need for an external antenna. Reception from some stations may be improved by rotating the whole receiver; this is due to the slight directional characteristic of the loop antenna. In extremely noisy locations, rotate the entire receiver till minimum noise and maximum signal pickup are obtained. For additional pickup, an external antenna may be connected by winding lead-in wire in slots on radio back panel.

GROUND. Never connect antenna or chassis to water pipe, radiator or other ground.

MODELS 58R11A, 58R12A, 58R13A,
58R14A, 58R15A, 58R16A; Ch. HS-184

ALIGNMENT

If AC power is used, use an isolation transformer between power line and receiver. If isolation transformer is not available, connect low side of signal generator to B- through .1 mf capacitor.

Connect low range output meter across speaker voice coil and set volume control at maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing signal generator output as stages are brought into alignment. Use a small fibre screwdriver for aligning IF & diode transformers.

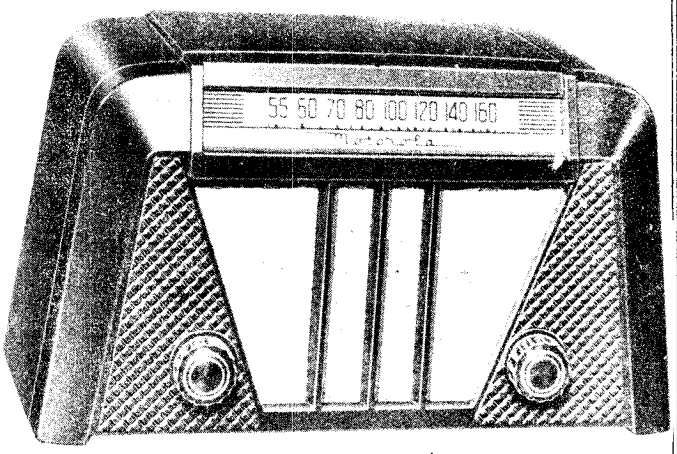
GENERAL INFORMATION

TYPE - AC-DC table model superheterodyne receiver with loop antenna.

TUNING RANGE - 535 to 1620 kc IF- 455 Kc

TUBE COMPLEMENT - 12BE6 Converter
12BA6 IF Amplifier
12AT6 Detector, AVC & 1st AF Amp.
50B5 Power Amplifier
35W4 Rectifier

POWER SUPPLY - 105 to 125 volts AC or DC, 35 watts



MODEL 58X11Q (Walnut Plastic Cabinet) MODEL 58X12Q (Ivory Plastic Cabinet)

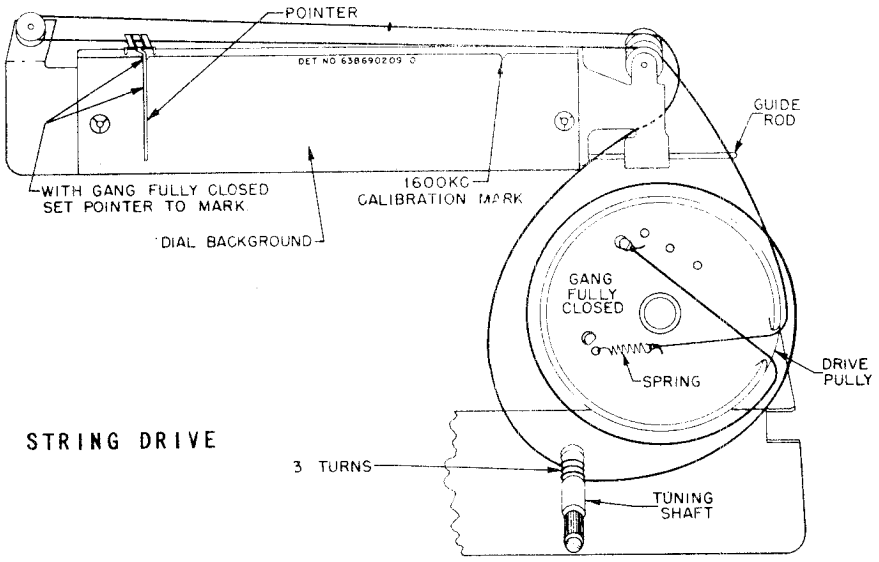


FIGURE 1. STRING DRIVE

INSTALLATION & OPERATING INSTRUCTIONS

POWER SWITCH AND VOLUME CONTROL. Operated with the left-hand knob. NOTE: Reverse the line cord plug in the wall outlet if radio does not operate from DC. When operating from AC, reversing the line cord plug in the wall outlet may sometimes improve reception and reduce hum.

TUNING. Tune stations with right-hand knob.

ANTENNA. A loop antenna is built into this receiver, eliminating the need for an external antenna. Reception from some stations may be improved by rotating the whole receiver; this is due to the slight directional characteristic of the loop antenna. In extremely noisy locations, rotate the entire receiver till minimum noise and maximum signal pickup are obtained. For additional pickup, an external antenna may be connected by winding lead-in wire in slots on radio back panel.

GROUND. Never connect antenna or chassis to water pipe, radiator or other ground, as one side of the power line is connected directly to chassis.

©John F. Rider

MODELS 58X11Q,
58X12Q; Ch. HS-140

ALIGNMENT

If AC power is used, use an isolation transformer between power line and receiver. If isolation transformer is not available, connect low side of signal generator to chassis through .1 mf capacitor.

Connect low range output meter across speaker voice coil and set volume control at maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing signal generator output as stages are brought into alignment. Use a small fibre screwdriver for aligning IF & diode transformers. Set pointer to calibration mark on left-hand side of dial background when gang is fully closed before starting alignment.

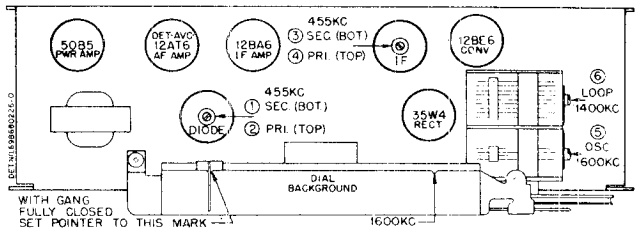

FIGURE 2. TUBE & TRIMMER LOCATIONS

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	POINTER SET TO	ADJUST	REMARKS
IF ALIGNMENT						
1.	.1 mf	Rear stator of tuning capacitor	455 Kc	Gang opened	1, 2, 3 & 4	Adjust for maximum.
RF ALIGNMENT						
2.	-	Radiation loop*	1600 Kc	1600 Kc	5	Adjust for maximum.
3.	-	Radiation loop*	1400 Kc	Tune for maximum	6	Adjust for maximum.

* Connect generator output to 5" diameter, 3 turn loop and couple to receiver loop. Keep loops at least 12" apart.

MODEL 59F11,
Ch. HS-188

GENERAL INFORMATION

TYPE - AC operated, portable radio phonograph combination with loop antenna.

TUNING RANGE - 535 to 1620 Kc IF - 455 Kc

TUBE COMPLEMENT - 12BE6 Converter
12BA6 IF Amplifier
12AT6 Detector-AVC-AF Amplifier
50C5 Power Amplifier
35W4 Rectifier

POWER SUPPLY - 117V AC only, 60 cycles, 40 watts

RECORD CHANGER - Model C2RC for playing small diameter, fine groove (45 RPM) records. For complete record changer information, see Motorola Service Manual Part No. 54P690245.

RADIO OPERATION

ANTENNA. No outside antenna or ground is required for radio reception. A loop antenna for radio reception is built into this receiver.

VOLUME CONTROL. The volume control and power switch for both radio and phonograph operation are combined and operated with the small left-hand knob.

RADIO PHONO SWITCH. Rotate the small right-hand knob to the left for radio operation; to the right is phonograph playing position.

SERVICE NOTES

TO SERVICE TUBES

The tubes are accessible by removing the rear ventilating grille; 6 wood screws hold the grille in place.

NEEDLE REPLACEMENT

1. To remove the needle from the cartridge, merely pull the needle 'out' from the cartridge using pliers or with your fingers.
2. The replacement needle is partly encased in a small guard to protect the needle point; push the needle into its position in the cartridge and remove the guard. Friction will hold the needle in position. Use Motorola needle, Part No. 47R690971

TO REMOVE CHASSIS & ANTENNA

1. Remove the control knobs.
2. Remove the front grille assembly; 16 Phillips head wood screws hold it in place. Also remove the front grille patch plate; 2 Phillips head wood screws hold it in place.
3. Remove the 2 chassis mounting screws and washers and disconnect the antenna. The chassis may now be removed from the cabinet.
4. The antenna is secured to the cabinet with staples.

TO REMOVE RECORD CHANGER

1. Remove the control knobs from radio.
2. Remove the front grille assembly; 16 Phillips head wood screws hold it in place. Also remove the front grille patch plate; 2 Phillips head wood screws hold it in place.
3. Remove the 3 screws and fibre washers that secure the changer to the cabinet.
4. Disconnect the leads and lift the changer from the cabinet.

MODEL 59F11,
Ch. HS-188

ALIGNMENT

Use an isolation transformer between power line and receiver. If isolation transformer is not available, connect low side of signal generator to B- through .1 mf capacitor.

Connect low range output meter across speaker voice coil and set volume control at maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing signal generator output as stages are brought into alignment. Use a small fibre screwdriver for aligning IF & diode transformers.

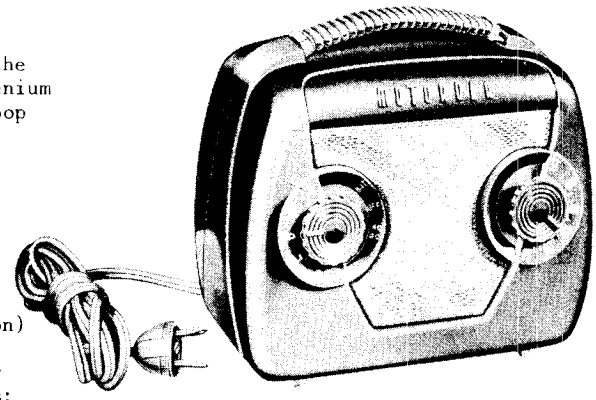
MODELS 59L11Q, 59L12Q,
59L14Q; Ch. HS-187

GENERAL INFORMATION



TYPE - A three-power (AC/DC Battery) portable receiver of the personal type. Four miniature type tubes and a selenium rectifier are used in a superheterodyne circuit. Loop antenna is housed inside rear cover.

TUNING RANGE - 535 to 1620 Kc IF - 455 Kc

TUBE COMPLEMENT - 1R5 - Converter
1U4 - IF Amplifier
1U5 - Detector, AVC & 1st AF Amplifier
3S4 - Power Amplifier
Rectifier - Selenium type (for AC/DC operation)

POWER SUPPLY - Operates from 117 volts AC/DC (15 watts) or from the following self-contained batteries:

Two 1-1/2V flashlight cells (Eveready #950 or equivalent)
One 67-1/2V "B" battery (Eveready #467 or equivalent)

INSTALLATION & OPERATING INSTRUCTIONS

CONTROLS. The power switch is operated by a three-position switch lever located under the volume (left-hand) knob. When the switch lever is in "BAT" position, the receiver will operate from its internal batteries; in "AC-DC" position, the receiver will operate from 117 volt house current. Move the lever to "OFF" position when the receiver is not in use.

Stations are tuned in with the right-hand knob. The markings around the tuning knob may be read in kilocycles by adding one zero to the figures.

HOUSE CURRENT OPERATION. Open the rear cover and remove the power cord from inside of the cabinet; pass the cord through the slot in the cover before closing. Connect the power plug to any 117 volt AC or DC outlet. Reverse the power plug in the power outlet if the receiver does not operate from DC power.

If the receiver is to be operated for long periods of time on AC or DC, or is to be placed in storage, remove the batteries and store them in a cool place; this will prevent battery leakage and possible damage to receiver.

BATTERY OPERATION. Open the rear cover and install the batteries. The rear cover is opened by inserting the fingertips into the slots under the handle and pulling back. Complete battery installation instructions will be found on the label inside the receiver or see Figure 1.

When low volume or fuzzy tone is noticed, replace the flashlight cells. Normally, the 67-1/2 volt "B" battery will last for 3 or 4 changes of the flashlight cells. Run-down batteries should not be left inside receiver, as they may leak and cause damage.

The condition of the batteries will not affect the operation of the receiver from AC or DC house current.

SERVICE NOTES

The chassis of this receiver is connected directly to the power line. When operating the set with the chassis outside of its cabinet (from AC power line), use an isolating transformer between power line and receiver to reduce possibility of electrical shock.

Tubes can be replaced without removing the chassis from the cabinet; open the back cover and remove the chassis insulator to expose the tubes. Two plug buttons hold the chassis insulator in position.

To remove the chassis from the cabinet:

1. Remove the control knobs and switch lever.
2. Open the back cover and remove the chassis insulator.
3. Disconnect the two loop leads from the pin receptacles.
4. Remove the two Phillips head screws on each end of the chassis and slide chassis from the cabinet.

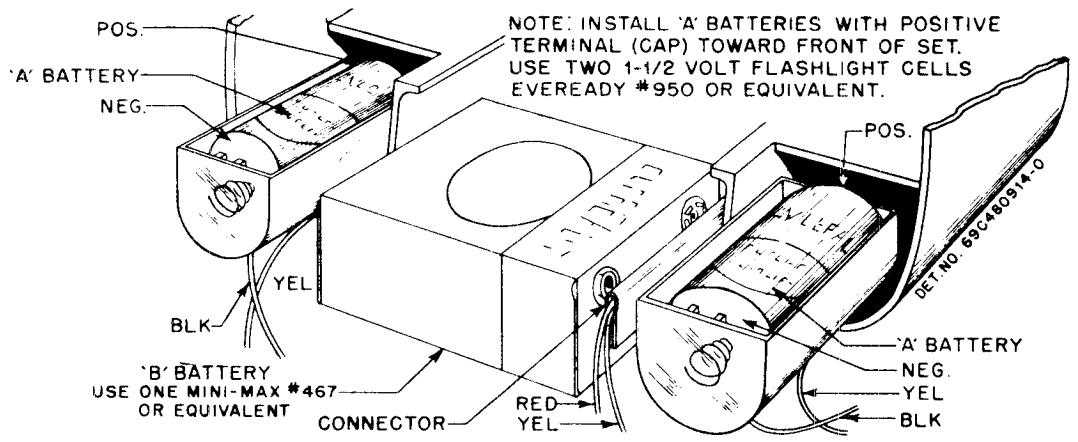

FIGURE 1. BATTERY REPLACEMENT DETAIL

ALIGNMENT

It is recommended that the receiver be operated from battery power during alignment. If the receiver is operated from AC power during alignment, use an isolation transformer between the power line and receiver. If an isolation transformer is not available, connect the low side of the signal generator to chassis through a .1 mf capacitor.

Connect a low range output meter across the speaker voice coil and set the volume control at maximum. For greatest accuracy, keep the output of the receiver at approximately .05 watts (.05 watts = .40 volts on output meter) throughout alignment by reducing the signal generator output as stages are brought into alignment. Use a small fibre screwdriver for aligning the IF and diode transformers.

The loop antenna should be connected to the chassis during alignment.

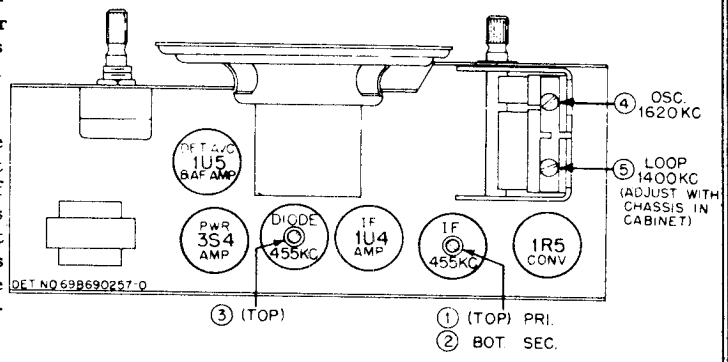

FIGURE 2. TUBE & TRIMMER LOCATIONS

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	DIAL SET TO	ADJUST	REMARKS
IF ALIGNMENT						
1.	.1 mf	Stator lug of tuning capacitor	455 Kc	Gang opened	1, 2 & 3	Adjust for maximum
RF ALIGNMENT						
2.	.1 mf	"	1620 Kc	"	4	Adjust for maximum
3.	-	-	-	-	-	**Install chassis in cabinet, leaving output meter connected to speaker.
4.	-	Radiation loop*	1400 Kc	Tune for maximum	5	Adjust for maximum. Trimmer is reached through hole under left-hand battery holder.

* Connect generator output to 5" diameter 3 turn loop and couple to receiver loop. Keep loops at least 12" apart.

** As an alternate method, the output meter may be disconnected at this point and the set installed in the cabinet. Tune in a weak station near 1400 Kc and adjust trimmer #5 through the hole in the bottom of the cabinet for maximum signal output.

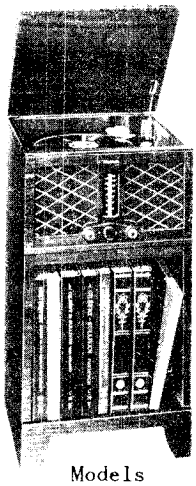
MODELS 68F11, 68F12, 68F14, 68F14B, 68F14M; Ch. HS-124

Model
68F11



Models
68F14, 68F14M & 68F14B

Model
68F12

GENERAL INFORMATION

TYPE - 68F11 - Table model, plastic-walnut cabinet
68F12 - Table model, wood-mahogany cabinet
68F14 - Petite Console model, wood, brown mahogany cabinet
68F14M- Petite Console model, wood, red mahogany cabinet
68F14B- Petite Console model, wood, blonde mahogany cabinet

The above models are of the radio-phonograph combination type, receiving only the standard broadcast band (AM). A built-in loop antenna is used. Chassis HS-124 is used in all five models.

TUNING RANGE - 535 to 1620 Kc. IF FREQUENCY - 455 Kc.

TUBE COMPLEMENT - (six)
12AU6 Mixer
6C4 Oscillator
12BA6 IF Amplifier
6AQ6 Detector, AVC & 1st AF Amplifier
50B5 Power Amplifier
35W4 Rectifier

POWER SUPPLY - 105-125V, 60 cycles, 55 watts (with record changer).

RECORD CHANGER - Models 68F11, 68F14, 68F14M & 68F14B use Record Changer RC-34; Model 68F12 uses Record Changer RC-30A. For complete record changer information refer to Service Manual, Part No. 54P484953.

INSTALLATION & OPERATING INSTRUCTIONS

Refer to Figure 1 for operating control locations.

POWER SWITCH AND VOLUME CONTROL. The power switch and volume control are combined and operated with the left-hand knob. Turn radio ON by rotating volume knob to the right until a 'click' is heard. Continued rotation of this control to the right will increase volume. Turn receiver OFF by rotating volume knob to the left until a 'click' is heard.

ANTENNA. A loop antenna is built into this receiver, eliminating the need for an external antenna. Reception from some stations may be improved by rotating the receiver; this is due to the slight directional characteristic of the loop antenna. For additional pick-up on Models 68F11 & 12, an external antenna may be connected to the wire on back of set, or to Models 68F14, M & B, by passing external antenna lead-in through hole in cabinet back and connecting to loose lead taped to inside of cabinet.

CAUTION: Never connect antenna or chassis to water pipe, radiator, or other ground.

TUNING. The calibrated dial scale is read in kilocycles by adding one '0' to the figures. Tune carefully until you are exactly on the station; tuning to either side of it will result in noisy reception and poor tone quality. Do not regulate volume by detuning the station; always tune exactly 'on' the station, then adjust volume control as desired.

©John F. Rider

MODELS 68F11, 68F12, 68F14, 68F14B, 68F14M; Ch. HS-124

PHONO SWITCH. The radio will not play unless the PHONO button is out (flush with REJECT button). Alternate pushes will lock the button 'in' for phono operation and 'out' for radio reception.

TONE SWITCH. Alternate pushes on TONE button will change the tone to bass or treble. Bass position is with button 'in'.

MOTOR SWITCH. Push the MOTOR button 'in' to allow the turntable to revolve; the button will lock in position. To stop the turntable, again push the button 'in' and release; the button will snap back to the 'off' position.

REJECT SWITCH. Momentarily push 'in' the REJECT button to begin the playing of the records. The button may be pushed 'in' to reject a record before it has been completely played.

RECORD CHANGER. Refer to Record Changer Service Manual 54P484953 for record changer operation.

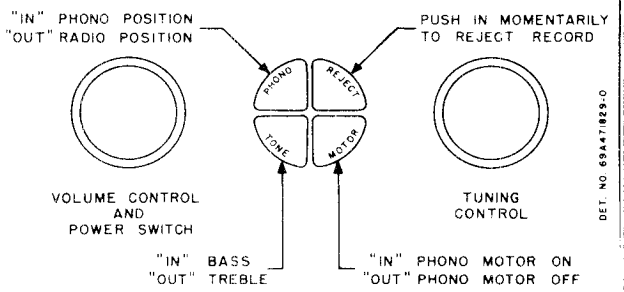


FIGURE 1. CONTROLS

SERVICE NOTES

HOW TO REPLACE PHONOGRAPH NEEDLE

This record player is equipped with a permanent point long-life needle which is good for several thousand plays unless damaged by mishandling. To replace a phonograph needle, loosen the small knurled nut that holds the needle in place. The nut is accessible from the bottom of pick-up arm. Use a pair of long nose pliers or tweezers to avoid damaging the crystal cartridge. Recommended replacement needle is Motorola Part No. 47K471596. CAUTION: Standard type needles will not work.

IF & DIODE REPLACEMENT

NOTE: Two types of IF & Diode transformers are being used. One type has iron cores that are tuned by means of slotted brass screws. These transformers must be used with shields having an internal iron core sleeve.

The other type of transformers have threaded cores moving inside of a threaded coil form. Plain shields must be used with these transformers.

MODELS 68F11, 12, 68F14,
68F14B, 68F14M; Ch. HS-124

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

It is suggested that an isolating transformer be used between receiver and power line during alignment. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator through a .1 mf capacitor to B- instead of the receiver chassis.

A low range output meter should be connected across the speaker voice coil. Set receiver volume control to maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing signal generator output (not receiver volume control) as stages are brought into alignment.

NOTE: Two types of IF & diode transformers are used in this chassis. One type has cores with slotted brass adjustment screws; the other type has threaded cores that move inside a threaded coil form. To adjust the latter type, use a small fiber screwdriver and do not use undue pressure as damage to the core or coil form may result.

STEP	DIAL SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	Mixer Grid (pin #1)	455 Kc	1,2,3 & 4	Adjust for maximum.
RF ALIGNMENT						
2.	Gang fully opened	.1 mf	Mixer Grid (pin #1)	1620 Kc	5	This sets oscillator to dial scale. (Check pointer calibration by referring to Figure 2.)
3.	1400 Kc	None	Radiation loop*	1400 Kc	6	Tune signal in on receiver, then adjust trimmer (6) for maximum. After set is assembled in cabinet, re-peak this trimmer.

* Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of 50 milliwatts (.40V) on output meter. Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

Brown Plastic Cabinet

GENERAL INFORMATION

TYPE-AC-DC operated, table model, superheterodyne receiver with loop antenna.

TUNING RANGE- 535 to 1620 Kc

IF FREQUENCY - 455 Kc

TUBE COMPLEMENT - 14C7 - RF Amplifier
14Q7 - Oscillator-Modulator
12B7
or 14A7 - IF Amplifier
14B6 - Detector-AVC-1st AF Amplifier
35A5 - Power Amplifier
35Y4 - Rectifier

POWER SUPPLY - 105-125 volts, AC or DC, 30 watts

INSTALLATION & OPERATING INSTRUCTIONS

POWER SWITCH AND VOLUME CONTROL. The power switch and volume controls are combined and operated with with the left-hand knob.

NOTE: If the receiver does not operate from a direct current (DC) line after being turned ON for a few minutes, reverse the line cord plug in the wall outlet. When operating from an AC line, reversing the line cord plug in the wall outlet may sometimes improve reception and reduce hum.

TUNING. Tune stations with the right-hand knob. The calibrated dial scale is read in kilocycles by adding one "0" to the figures.

ANTENNA. A loop antenna is built into this receiver, eliminating the need for an external antenna. Reception from some stations may be improved by rotating the whole receiver; this is due to the slight directional characteristic of the loop antenna. In extremely noisy locations, rotate the entire receiver till minimum noise and maximum signal pickup are obtained. For additional pickup, an external antenna may be connected as shown on back of receiver.

CAUTION: Never connect antenna or chassis to water pipe, radiator or other ground.

SERVICE NOTE

IF & DIODE TRANSFORMER REPLACEMENT

Two types of IF & Diode transformers are being used. One type has iron cores that are tuned by means of slotted brass screws. These transformers must be used with shields having an internal iron core sleeve.

The other type of transformers have threaded cores moving inside of a threaded coil form. Plain shields must be used with these transformers.

MODELS 68X11, 68X11A, 68X12, 68X12A; Ch. HS-127, HS-127A

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment. Follow the procedure carefully.

If receiver is operated from AC line during alignment, it is suggested that an isolating transformer be used between receiver and power line during alignment. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator through a .1 mf capacitor to B- instead of the receiver chassis.

A low range output meter should be connected across the speaker voice coil. Set receiver volume control to maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing signal generator output (not receiver volume control) as stages are brought into alignment.

NOTE: Two types of IF & diode transformers are used. One type has cores with slotted brass adjustment screws; the other type has threaded cores that move inside a threaded coil form. To adjust the latter type, use a small fiber screwdriver and do not use undue pressure, as damage to the core or coil form may result.

ALIGNMENT PROCEDURE

STEP	DIAL SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET TO	ADJUST TRIMMER OR CORE	REMARKS
IF ALIGNMENT						
1.	Gang fully opened	.1 mf	RF Amp grid*	455 Kc	1, 2, 3 & 4	Adjust for maximum
WAVETRAP						
2.	Gang fully opened	.1 mf	RF Amp grid*	455 Kc	5	Adjust for minimum
RF ALIGNMENT						
3.	1620 Kc**	.1 mf	RF Amp grid*	1620 Kc	6	This sets oscillator to dial scale
4.	1400 Kc	None	Radiation loop***	1400 Kc	7	Tune signal in on receiver, then peak trimmer 7

* A convenient point is the stator of the RF section of the tuning capacitor.

** First close gang fully and set pointer to calibration mark at left-hand side of dial background, then set pointer to 1620 Kc calibration mark (by means of tuning knob) on right-hand side of dial background. See Figure 6.

*** Connect output of signal generator to a 5" diameter, 3 turn loop and bring loop close enough to receiver loop to obtain output of 50 milliwatts (.40V) on output meter. Vary distance between loops to maintain this output during alignment. Minimum distance between loops should never be less than 12".

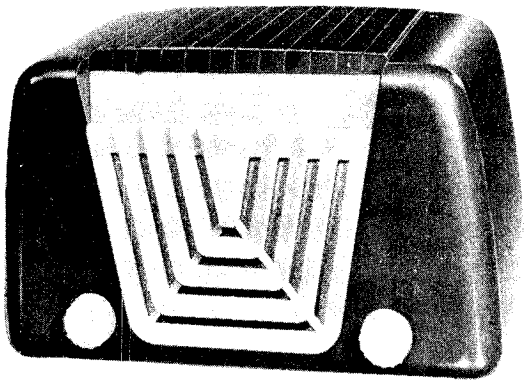

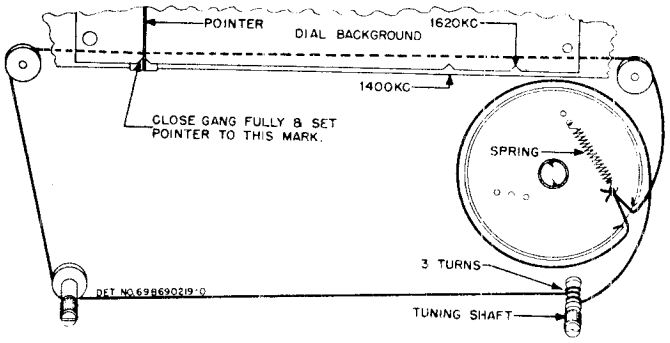

FIGURE 1.
DIAL CORD RESTRINGING DETAIL

Model 68X11Q Maroon Plastic Cabinet
Model 68X12Q Brown Plastic Cabinet
Model 68X13O Ivory Plastic Cabinet

GENERAL INFORMATION

TYPE - AC-DC operated table model superheterodyne receiver with loop antenna.

TUNING RANGE - 535 to 1620 Kc IF - 455 Kc

TUBE COMPLEMENT - 12BA6 RF Amplifier; 12BE6 Converter; 12BA6 IF Amplifier; 12AT6 Detector, AVC & 1st AF Amplifier; 35B5 Power Amplifier; 35W4 Rectifier

POWER SUPPLY - 105 to 125 volts AC or DC, 35 watts

ALIGNMENT

If AC power is used, use an isolation transformer between power line and receiver. If isolation transformer is not available, connect low side of signal generator to chassis through .1 mf capacitor.

Connect low range output meter across speaker voice coil and set volume control at maximum. For greatest accuracy, keep output of receiver at approximately .05 watt (.05 watt = .40 volt on output meter) throughout alignment by reducing signal generator output as stages are brought into alignment. Use a small fibre screwdriver for aligning IF & diode transformers. Set pointer to calibration mark on left-hand side of dial background when gang is fully closed before starting alignment.

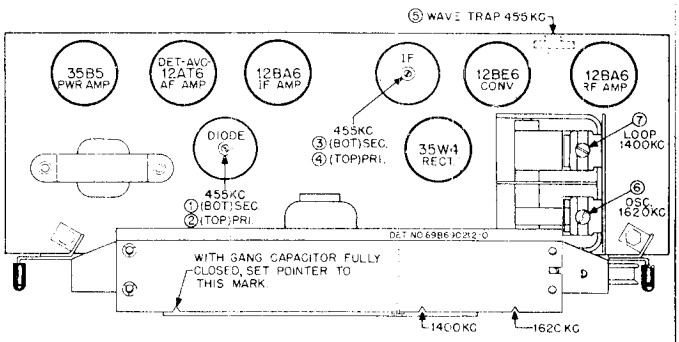

FIGURE 2. TUBE & TRIMMER LOCATIONS

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	POINTER SET TO	ADJUST	REMARKS
IF ALIGNMENT						
1.	.1 mf	Rear stator of tuning capacitor	455 Kc	Gang opened	1, 2, 3 & 4	Adjust for maximum.
WAVETRAP						
2.	"	"	"	"	5	Adjust for minimum.
RF ALIGNMENT						
3.	"	"	1620 Kc	1620 Kc	6	Adjust for maximum.
4.	None	Radiation loop*	1400 Kc	Tune for maximum	7	Adjust for maximum.

* Connect generator output to 5" diameter, 3 turn loop and couple to receiver loop. Keep loops at least 12" apart.

MODEL 69L11,
Ch. HS-175

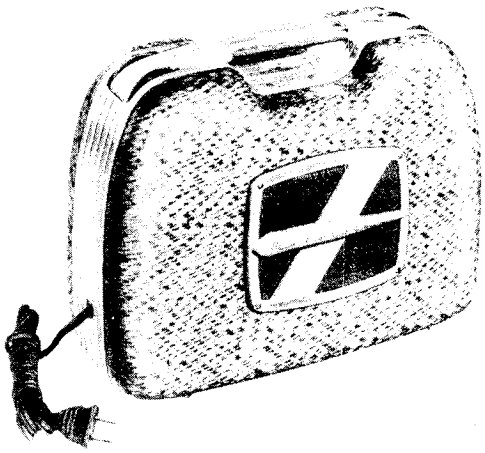
GENERAL INFORMATION

TYPE - Five-tube, three-power (AC/DC Battery) portable, with a selenium rectifier. A loop antenna is housed in the back cover.

TUNING RANGE - 535 to 1620 Kc IF - 455 Kc

TUBE COMPLEMENT - 1U4 - RF Amplifier
1R5 - Oscillator-Modulator
1U4 - IF Amplifier
1S5 - Detector, AVC & 1st AF Amplifier
3V4 - Power Amplifier
Rectifier - Selenium type

POWER SUPPLY - Operates from 117 volts AC or DC (15 watts), or self-contained battery pack. Use Eveready #753 or General #60A-6F6-5.



INSTALLATION & OPERATING INSTRUCTIONS

CONTROLS. The volume control and power switch are combined and are operated with the left-hand knob. Select stations with the right-hand knob. The dial scale is read in kilocycles by adding one zero to the figures.

TO OPEN BACK COVER. Press down on the latch, (directly below handle) simultaneously pulling the cover open. To close, merely snap together. **CAUTION:** When closing the cover, be careful not to pinch the line cord or other leads between the cover and cabinet.

HOUSE CURRENT OPERATION. The power cord is located inside the cabinet and can be reached by opening the back cover; pass the cord through the slot before closing the cover. Plug the power plug into any 117 volt AC or DC outlet. Reverse the line cord plug in power outlet if the receiver does not operate from DC power.

BATTERY OPERATION. Open the back cover and install the battery pack following the instructions on the label located on the inside of the receiver back cover. Plug the line cord plug into the receptacle on the receiver chassis or the receiver will not operate from its battery. If the receiver is to be operated for a long period of time from AC or DC, or is to be placed in storage, remove the battery and store it in a cool place. Replace the battery when low volume or fuzzy tone is noticed. The condition of the battery will not affect the operation of the receiver when operating from AC or DC.

ALIGNMENT

It is recommended that the receiver be operated from battery during alignment. If AC power is used when aligning the receiver, use an isolation transformer between the power line and receiver. If an isolation transformer is not available, connect the low side of the signal generator to B- through .1 mf capacitor.

Connect a low range output meter across the speaker voice coil and set the volume control at maximum. For greatest accuracy, keep the output of the receiver at approximately .05 watts (.05 watts = .40 volts on output meter) throughout alignment by reducing the signal generator output as stages are brought into alignment. Use a small

fibre screwdriver for aligning the IF & diode transformers.

Normally, RF alignment can be made with trimmers 5, 6 & 7. However, if the range of these trimmers is insufficient to obtain a peak, adjust trimmers 5A & 6A.

The inductance of the RF coil (T-1) is set by the manufacturer by adjusting the iron core. No resetting of this core should be made unless it has been tampered with. Readjustment can be made by proceeding as follows:

Tune in a 600 Kc signal and peak padder (8). Next tune in a 1400 Kc signal and peak trimmer (6). Repeat both adjustments until maximum response is obtained at both ends; the last adjustment should be trimmer (6).

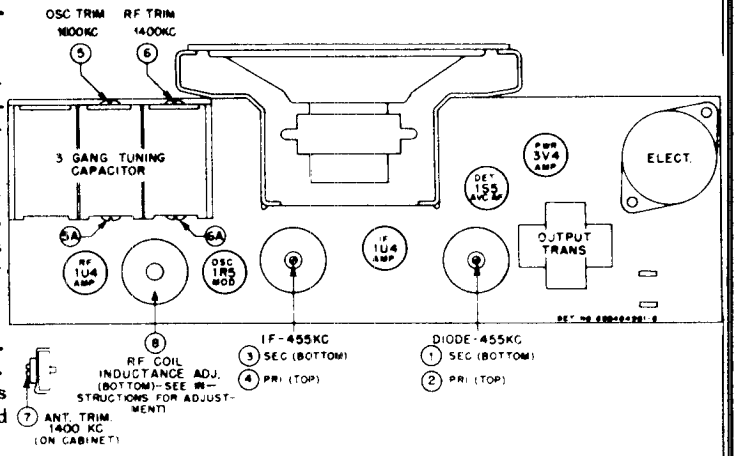

FIGURE 1. TUBE & TRIMMER ADJUSTMENT LOCATIONS

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	POINTER SET TO	ADJUST	REMARKS
IF ALIGNMENT						
1.	.1 mfd	Stator of tuning gang	455 Kc	Gang opened	1, 2, 3 & 4	Adjust for maximum
RF ALIGNMENT						
2.	-	Radiation loop**	1600 Kc	1600 Kc*	5	Adjust for maximum
3.	-	"	1400 Kc	Tune for maximum	6 & 7	Adjust for maximum
4.	-	"	"	"	7	With chassis assembled into cabinet, adjust for maximum

* First close gang and set mark on dial scale to calibration line (See Figure 2). Then set to 1600 Kc.

** Connect generator output to 5" diameter 5 turn loop and couple to receiver loop. Keep loops at least 12" apart.

GENERAL INFORMATION

TYPE- FM-BC radio-phonograph combination. A loop antenna is used for broadcast (AM) reception; for FM reception, a line cord antenna is used. A selenium type rectifier is used in the power supply.

Chassis HS-128 & HS-132 are identical except for dial arrangements and phono connecting cord lead lengths.

TUNING RANGE - BC - 535 to 1620 Kc
FM - 88 to 108 Mc

AM IF Frequency - 455 Kc
FM IF Frequency - 4.3 Mc

TUBE COMPLEMENT -
12AT7 - 1st & 2nd FM Converter
12BE6 - 1st 4.3 Mc IF Amplifier & AM Converter
12BA6 - 2nd 4.3 Mc IF Amplifier & 455 Kc IF Amplifier
12BA6 - 3rd 4.3 Mc IF Amplifier
19T8 - FM Ratio Detector, AM Detector, AVC & 1st AF Amplifier
50B5 - Power Output Amplifier
Rectifier- Selenium type

POWER SUPPLY - 105-125 volts, AC, 60 cycles, 85 watts

RECORD CHANGER -Motorola Model RC-34. Refer to Motorola Service Manual, Part No. 54P484953 for record changer service information and operating instructions.

FM-BC TUNER - Refer to PT-19 Service Manual, Motorola Part No. 54P485033, for tuner information.

INSTALLATION & OPERATING INSTRUCTIONS

ANTENNAS. No outside antenna or ground is normally required for broadcast reception. An 'Aero-Vane' loop antenna for broadcast reception is located at the rear of the cabinet. In locations where additional pick-up is desired, an external antenna may be connected to the screw on the rear of the set marked 'BC'. See Figure 1.

An FM antenna, built into the power cord, eliminates the need for an external FM antenna when the receiver is used in normal FM service areas such as are found in and for a few miles around metropolitan areas being served by FM stations. In 'fringe' or weak FM signal areas, improved FM re-

ception can be obtained by using a dipole antenna mounted as high as possible. The dipole antenna should be connected through a 300 ohm twin transmission line to the two screws on the rear of the set as shown in Figure 1. The jumper between the two terminals should be opened as shown. Orient the dipole antenna so maximum volume of FM station or stations is obtained.

CONTROLS. Refer to Figure 2 for instructions pertaining to use of the controls located on the receiver front panel.

The standard broadcast dial scale is read in kilocycles by adding one '0' to figures. The FM band dial scale is read in megacycles (88 to 108).

NOTE: When tuning, tune carefully until you are exactly ON the station. Tuning to either side of it will result in poor tone quality and excessive noise. Tuning of FM stations should be done very carefully, as 3 peaks are present; the center peak is the correct one; distortion and low volume are characteristic of the other two peaks.

RECORD CHANGER OPERATION. Refer to Motorola Model RC-34 Record Changer Service Manual, Part Number 54P484953 of operating instructions.

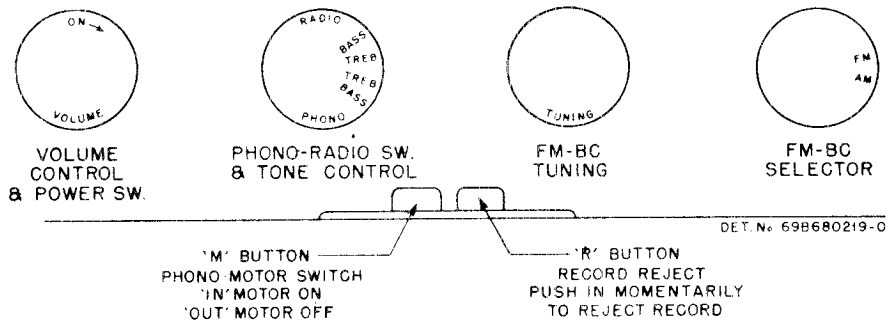

FIGURE 2. OPERATING CONTROLS

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment.

It is suggested that an isolation transformer be used between receiver and power line. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator output through a .1 mf capacitor to receiver common negative (see schematic diagram) instead of the receiver chassis.

If set oscillates when aligning the broadcast band, connect receiver common negative to receiver chassis.

CAUTION: Don't forget to disconnect common negative from receiver chassis after alignment.

Use an insulated wrench when aligning the FM tuner cores and trimmers. Order Motorola FM Alignment Wrench, Part No. 66A471864.

Some chassis use AM IF & diode transformers having cores that are threaded and screw into threaded coil forms. These cores are slotted for a small diameter fiber screwdriver. Do not press hard on these cores during alignment or the threads on the core or coil form may strip.

The FM oscillator trimmer (adjustment 21 in Figure 2) will not be found on all tuners used in these chassis. Complete instructions for aligning tuners with or without this trimmer will be found in alignment charts.

Check setting of dial pointer before starting alignment. With gang fully closed, pointer should be in line with last mark on extreme left-hand side of dial scale. If necessary, reset pointer on string.

Refer to Figure 3 for location of all alignment trimmers and cores.

COMPLETE ALIGNMENT PROCEDURE USING AM SIGNAL GENERATOR

An AM (30% amplitude modulated) signal generator covering the frequencies shown in Alignment Chart I, is used to align the broadcast and FM bands. A low range output meter, connected across the speaker voice coil, is used as an output indicator.

The broadcast alignment is conventional; instructions are given in the following alignment chart.

The FM band alignment can be satisfactorily performed by following the instructions in the chart When properly aligned, the ratio detector does not respond to amplitude modulation and since an AM type signal generator is used for aligning the FM circuits, it is necessary to detune the ratio detector transformer secondary and leave it that way until all of the FM circuits have been aligned. After completing the alignment of FM circuits, proceed to align the ratio detector transformer secondary by applying a 4.3 Mc AM signal to the control grid (pin #7) of the 2nd FM converter tube and adjusting the ratio detector transformer secondary core for minimum audio output. No adjustment of the FM circuits should be attempted with AM after the ratio detector transformer secondary has been properly aligned.

Keep output of signal generator low so as not to overload stages and obtain false output indications. Keep receiver volume control at maximum; reduce generator output, as stages are brought into alignment, so output meter never reads more than .40 volt (.05 watt).

1.	High freq. end.	BC	.1 mf	12BE6 (V-2) BC Conv Grid (Pin #7)	455 Kc	1,2,3 & 4	Adjust for maximum output.
BROADCAST BAND ALIGNMENT							
2.	1620 Kc (gang fully opened)	BC	.1 mf	"	1620 Kc	5	Adjust for maximum output. This sets oscillator to dial scale.
3.	1400 Kc	BC	None	Radiation loop*	1400 Kc	6	Tune in signal with receiver tuning knob, then peak trimmer 6.
4.3 MC IF CHANNEL ALIGNMENT & WAVETRAP ADJUSTMENT							
4.	-	-	-	-	-	7	Detune ratio detector transformer secondary by screwing core (7) out as far as it will go.
5.	(extreme high frequency end)	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (Pin #7)	4.3 Mc	8,9,10, 11, 12, 13 & 14	Adjust for maximum output.
6.	-	FM	300 ohms	FM Ant terminal (center screw on back)	4.3 Mc	15	Adjust for minimum output (wavetrap)
FM BAND ALIGNMENT							
Note: If tuner does not have FM oscillator trimmer (21), perform step 7 & disregard steps 7A, B & C. If tuner has FM oscillator trimmer (21), then disregard step 7 and perform steps 7A, B & C in its place.							
7.	105 Mc	FM	300 ohms	FM Ant terminal (center screw on back)	105 Mc	16	Adjust for maximum output. This sets oscillator to dial scale.
7A.	90 Mc	FM	300 ohms	"	90 Mc	21	Adjust for maximum output.
7B.	105 Mc	FM	300 ohms	"	105 Mc	16	Adjust for maximum output.
7C.	-	-	-	-	-	-	Repeat steps 7A & 7B until oscillator tracks with dial calibration.
8.	90 Mc	FM	300 ohms	FM Ant terminal (center screw on back)	90 Mc	19 & 20	Tune in signal with receiver tuning knob, then adjust 19 & 20 for maximum output.
9.	105 Mc	FM	300 ohms	"	105 Mc	17 & 18	Tune in signal with receiver tuning knob, then adjust 17 & 18 for maximum output.
10.	-	-	-	-	-	-	Repeat steps 8 & 9 several times until further adjustment does not increase the output.
11.	105 Mc	FM	None	Radiate signal (or use weak station after performing step 12)	105 Mc	19	Adjust for maximum output with FM Ant link on back closed.

* Connect output of signal generator to a 5" diameter, 3 turn loop and radiate signal into receiver loop. Minimum distance between loops should never be less than 12".

78FM22M; Ch. HS-128, HS-132

ALIGN RATIO DETECTOR TRANSFORMER SECONDARY							
12.	-	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (Pin #7)	4.3 Mc	7	Adjust ratio detector transformer secondary for minimum response. The correct adjustment is sharply defined minimum response point between the two peaks.

CHART II. ALIGNMENT PROCEDURE WHEN USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

STEP — OPERATION

455 Kc IF Channel Alignment

1. Same as Step 1 in Chart I (Use AM signal generator).

Broadcast Band Alignment

2. Same as Steps 2 & 3 in Chart I (Use AM signal generator).

4.3 Mc IF Channel Alignment (Use FM Signal Generator & Oscilloscope)

3. (A) Ratio Detector

1. Connect the input terminals of the oscilloscope vertical amplifier to the high side of the receiver volume control and common negative.

2. Connect the FM generator synchronizing voltage output terminals to a phase shifting network, consisting of a variable 1/2 megohm resistor in series with a .002 mf capacitor. The input to the oscilloscope horizontal amplifier is connected across the .002 mf capacitor. See Figure 4. (This phase shifting network may not work with every oscilloscope. Different values of R & C may be required).

3. Apply an FM 4.3 Mc signal (125 Kc deviation) through a .001 mf capacitor to the control grid (pin #1) of tube V-4 (12BA6) in the third FM IF Amplifier stage.

4. Back out ratio detector transformer secondary core (7) several turns and then adjust ratio detector transformer primary (8) for maximum amplitude. The phase shifting network resistor is adjusted to give only one trace.

5. Adjust ratio detector transformer secondary (7) until a symmetrical pattern is obtained, with peaks occurring at about 100 Kc above and below 4.3 Mc and is substantially linear between peaks. The trace should pass through the intersection of the vertical and horizontal axis. The phase shifting network should be adjusted to give only a single pattern at all times. See Figure 5. It will be necessary to go over ratio detector transformer primary (8) and secondary (7) adjustments several times before a pattern of maximum amplitude and correct symmetry is obtained.

(B) 4.3 Mc IF Amplifiers & Wavetrap

1. Apply an FM 4.3 Mc signal (100 Kc deviation) to the control grid (pin #1) of tube V-3 (12BA6) in the 2nd FM IF amplifier stage, through a .001 mf capacitor and adjust both primary and secondary cores (9 & 10) to get a symmetrical pattern as before, with peaks occurring at a slightly lower deviation.

2. Move signal generator lead from tube V-3 to control grid (pin #1) of tube V-2 (12BE6) in the first FM IF amplifier stage, and adjust both primary and secondary cores (11 & 12) until a symmetrical pattern substantially linear between peaks is obtained.

3. Move signal generator lead from tube V-2 to FM antenna terminal (center clip on back). Turn 4.3 Mc wavetrap trimmer (15) off resonance and adjust both primary and secondary cores (13 & 14) until a symmetrical pattern substantially linear between peaks is obtained.

4. Leave signal generator connected to FM antenna terminal. Adjust 4.3 Mc wavetrap trimmer (15) for minimum output.

4. FM Band Alignment (Use FM Signal Generator & Output Meter)

(A) Connect generator output through a 300 ohm resistor to the receiver FM antenna terminal (center clip on back.)

(B) If tuner does not have oscillator trimmer (21) then set oscillator to dial scale as follows: Set receiver pointer to 105 Mc. Also set FM signal generator to 105 Mc (22-1/2 Kc deviation). Adjust FM oscillator core (16) for maximum output; this sets oscillator to dial scale.

If tuner does have oscillator trimmer (21) then set oscillator to dial scale as follows: Set receiver pointer to 90 Mc. Also set FM signal generator to 90 Mc (22-1/2 Kc deviation). Adjust FM oscillator trimmer (21) for maximum output. Next set receiver pointer and FM generator to 105 Mc and adjust FM oscillator core (16) for maximum output. Repeat oscillator adjustments at 90 Mc and 105 Mc until oscillator tracks with dial.

78FM22M; Ch. HS-128, HS-132

(C) Set FM signal generator to 90 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knob and then adjust FM variable IF and FM antenna trimmers (19 & 20) for maximum output.

(D) Set FM signal generator to 105 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knob and then adjust FM variable IF and FM antenna tuning cores (17 & 18) for maximum output.

(E) Repeat steps 4(C) and 4(D) until cores (17 & 18) and trimmers (19 & 20) reach their peak.

POWER SUPPLY - 105-125 volts AC, 60 cycles, 75 watts

TUNING RANGE - BC - 535 to 1620 Kc
FM - 88 to 108 Mc

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment.

It is suggested that an isolation transformer be used between receiver and power line. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator output through a .1 mf capacitor to receiver common negative (see schematic diagram) instead of the receiver chassis.

If set oscillates when aligning the broadcast band, connect receiver common negative to receiver chassis.

CAUTION: Don't forget to disconnect common negative from receiver chassis after alignment.

Use an insulated wrench when aligning the FM tuner cores and trimmers. Order Motorola FM Alignment Wrench, Part No. 66A471864.

The AM IF & diode transformer cores are threaded and screw into the threaded coil forms. These cores are slotted for a small diameter fiber screwdriver. Do not press hard on these cores during alignment or the threads on the core or coil form may strip.

The FM oscillator trimmer (adjustment 21 in Figure 2) will not be found on all tuners used in Chassis HS-133. Complete instructions for aligning tuners with or without this trimmer will be found in alignment charts.

Check setting of dial pointer before starting alignment. With gang fully closed, pointer should be in line with last mark on extreme left-hand side of dial scale. If necessary, reset pointer on string.

Refer to Figure 2 for location of all alignment trimmers and cores.

COMPLETE ALIGNMENT PROCEDURE USING AM SIGNAL GENERATOR

An AM (30% amplitude modulated) signal generator covering the frequencies shown in Alignment Chart I, is used to align the broadcast and FM bands A low range output meter, connected across the speaker voice coil, is used as an output indicator.

The broadcast alignment is conventional; instructions are given in the following alignment chart.

The FM band alignment can be satisfactorily performed by following the instructions in the chart When properly aligned, the ratio detector does not respond to amplitude modulation and since an AM type signal generator is used for aligning the FM circuits, it is necessary to detune the ratio detector transformer secondary and leave it that way until all of the FM circuits have been aligned. After completing the alignment of FM circuits, proceed to align the ratio detector transformer secondary by applying a 4.3 Mc AM signal to the control grid (pin #7) of the 2nd FM converter tube and adjusting the ratio detector transformer secondary core for minimum audio output. No adjustment of the FM circuits should be attempted with AM after the ratio detector transformer secondary has been properly aligned.

Keep output of signal generator low so as not to overload stages and obtain false output indications. Keep receiver volume control at maximum; reduce generator output, as stages are brought into alignment, so output meter never reads more than .40 volt (.05 watt).

CHART I. ALIGNMENT PROCEDURE WHEN USING AM MODULATED SIGNAL GENERATOR AND STANDARD OUTPUT METER FOR COMPLETE RECEIVER ALIGNMENT

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
455 KC IF CHANNEL ALIGNMENT							
1.	High freq. end.	BC	.1 mf	6BE6 (V-2) BC Conv Grid (Pin #7)	455 Kc	1,2,3 & 4	Adjust for maximum output.
BROADCAST BAND ALIGNMENT							
2.	1620 Kc (gang fully opened)	BC	.1 mf	6BE6 (V-2) BC Conv Grid (Pin #7)	1620 Kc	5	Adjust for maximum output. This sets oscillator to dial scale.
3.	1400 Kc	BC	None	Radiation loop*	1400 Kc	6	Tune in signal with receiver tuning knob, then peak trimmer 6.
4.3 MC IF CHANNEL ALIGNMENT & WAVETRAP ADJUSTMENT							
4.	-	-	-	-	-	7	Detune ratio detector transformer secondary by screwing core (7) out as far as it will go.
5.	(extreme high frequency end)	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (Pin #7)	4.3 Mc	8,9,10, 11, 12, 13 & 14	Adjust for maximum output.
6.	-	FM	300 ohms	FM Ant terminal (center clip on back)	4.3 Mc	15	Adjust for minimum output (wavetrap)
FM BAND ALIGNMENT							
Note:	If tuner does not have FM oscillator trimmer (21), perform step 7 & disregard steps 7A, B & C. If tuner has FM oscillator trimmer (21), then disregard step 7 and perform steps 7A, B & C in its place.						
7.	105 Mc	FM	300 ohms	FM Ant terminal (center clip on back)	105 Mc	16	Adjust for maximum output. This sets oscillator to dial scale.
7A.	90 Mc	FM	300 ohms	FM Ant terminal (center clip on back)	90 Mc	21	Adjust for maximum output.
7B.	105 Mc	FM	300 ohms	FM Ant terminal (center clip on back)	105 Mc	16	Adjust for maximum output.
7C.	-	-	-	-	-	-	Repeat steps 7A & 7B until oscillator tracks with dial calibration.
8.	90 Mc	FM	300 ohms	FM Ant terminal (center clip on back)	90 Mc	19 & 20	Tune in signal with receiver tuning knot, then adjust 19 & 20 for maximum output.
9.	105 Mc	FM	300 ohms	FM Ant terminal (center clip on back)	105 Mc	17 & 18	Tune in signal with receiver tuning knob, then adjust 17 & 18 for maximum output.

*Connect output of signal generator to a 5" diameter, 3 turn loop and radiate signal into receiver loop. Minimum distance between loops should never be less than 12".

(CHART I. ALIGNMENT CONT'D)

STEP	DIAL SET TO	BAND SW. SET TO	DUMMY	SIGNAL GENERATOR CONNECTED TO	SIGNAL GENERATOR SET AT	ADJUST TRIMMER OR CORE	REMARKS
10.	-	-	-	-	-	-	Repeat steps 8 & 9 several times until further adjustment does not increase the output.
11.	105 Mc	FM	None	Radiate signal (or use weak station after performing Step 12)	105 Mc	19	Adjust for maximum output with FM figure 8 antenna connected.
ALIGN RATIO DETECTOR TRANSFORMER SECONDARY							
12.	-	FM	.001 mf	12AT7 (V-1) 2nd FM Converter Grid (Pin #7)	4.3 Mc	7	Adjust ratio detector transformer secondary for minimum response. The correct adjustment is sharply defined minimum response point between the two peaks.

CHART II. ALIGNMENT PROCEDURE WHEN USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

STEP OPERATION

455 Kc IF Channel Alignment

1. Same as Step 1 in Chart I (Use AM signal generator).

Broadcast Band Alignment

2. Same as Steps 2 & 3 in Chart I (Use AM signal generator).

4.3 Mc IF Channel Alignment (Use FM Signal Generator & Oscilloscope)

3. (A) Ratio Detector

1. Connect the input terminals of the oscilloscope vertical amplifier to the high side of the receiver volume control and common negative.

2. Connect the FM generator synchronizing voltage output terminals to a phase shifting network, consisting of a variable 1/2 megohm resistor in series with a .002 mf capacitor. The input to the oscilloscope horizontal amplifier is connected across the .002 mf capacitor. See Figure 3 . (This phase shifting network may not work with every oscilloscope. Different values of R & C may be required).

3. Apply an FM 4.3 Mc signal (125 Kc deviation) through a .001 mf capacitor to the control grid (pin #1) of tube V-4 (6BA6) in the third FM IF Amplifier stage.

4. Back out ratio detector transformer secondary core (7) several turns and then adjust ratio detector transformer primary (8) for maximum amplitude. The phase shifting network resistor is adjusted to give only one trace.

5. Adjust ratio detector transformer secondary (7) until a symmetrical pattern is obtained, with peaks occurring at about 100 Kc above and below 4.3 Mc and is substantially linear between peaks. The trace should pass through the intersection of the vertical and horizontal axis. The phase shifting network should be adjusted to give only a single pattern at all times. See Figure 4 . It will be necessary to go over ratio detector transformer primary (8) and secondary (7) adjustments several times before a pattern of maximum amplitude and correct symmetry is obtained.

(B) 4.3 Mc IF Amplifiers & Wavetrap

1. Apply an FM 4.3 Mc signal (100 Kc deviation) to the control grid (pin #1) of tube V-3 (6BA6) in the

© John F. Rider

MODEL 88FM21,
Ch. HS-133

(CHART II. ALIGNMENT CONT'D)

OPERATION

2nd FM IF amplifier stage, through a .001 mf capacitor and adjust both primary and secondary cores (9 & 10) to get a symmetrical pattern as before, with peaks occurring at a slightly lower deviation.

2. Move signal generator lead from tube V-3 to control grid (pin #1) of tube V-2 (6BE6) in the first FM IF amplifier stage, and adjust both primary and secondary cores (11 & 12) until a symmetrical pattern substantially linear between peaks is obtained.

3. Move signal generator lead from tube V-2 to FM antenna terminal (center clip on back). Turn 4.3 Mc wavetrap trimmer (15) off resonance and adjust both primary and secondary cores (13 & 14) until a symmetrical pattern substantially linear between peaks is obtained.

4. Leave signal generator connected to FM antenna terminal. Adjust 4.3 Mc wavetrap trimmer (15) for minimum output.

4. FM Band Alignment (Use FM Signal Generator & Output Meter)

(A) Connect generator output through a 300 ohm resistor to the receiver FM antenna terminal (center clip on back.)

(B) If tuner does not have oscillator trimmer (21) then set oscillator to dial scale as follows: Set receiver pointer to 105 Mc. Also set FM signal generator to 105 Mc (22-1/2 Kc deviation). Adjust FM oscillator core (16) for maximum output; this sets oscillator to dial scale.

If tuner does have oscillator trimmer (21) then set oscillator to dial scale as follows: Set receiver pointer to 90 Mc. Also set FM signal generator to 90 Mc (22-1/2 Kc deviation). Adjust FM oscillator trimmer (21) for maximum output. Next set receiver pointer and FM generator to 105 Mc and adjust FM oscillator core (16) for maximum output. Repeat oscillator adjustments at 90 Mc and 105 Mc until oscillator tracks with dial scale.

(C) Set FM signal generator to 90 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knob and then adjust FM variable IF and FM antenna trimmers (19 & 20) for maximum output.

(D) Set FM signal generator to 105 Mc (22-1/2 Kc deviation). Tune in signal with receiver tuning knot and then adjust FM variable IF and FM antenna tuning cores (17 & 18) for maximum output.

(E) Repeat steps 4(C) and 4(D) until cores (17 & 18) and trimmers (19 & 20) reach their peak.

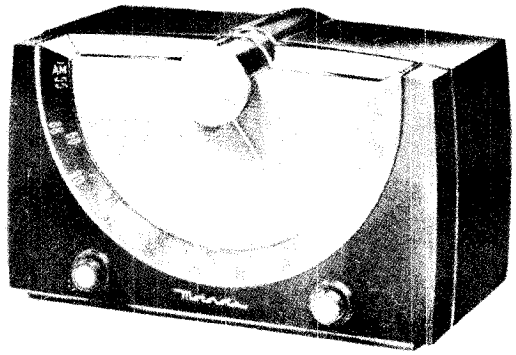
GENERAL INFORMATION



TYPE - FM-AM table model receiver

TUNING RANGE - AM 535 to 1620 Kc IF - 455 Kc
FM 88 to 108 Mc IF - 10.7 Mc

TUBE COMPLEMENT - 12BA6 - FM-AM RF Amplifier
12BA7 - FM-AM Converter
12BA6 - FM-AM IF Amplifier
12BA6 - FM IF Amplifier
19T8 - FM Ratio Detector, AM Detector & 1st Audio Amplifier
50C5 - Power Amplifier
Rectifier - Selenium type

POWER SUPPLY - 117V AC or DC, 40 watts

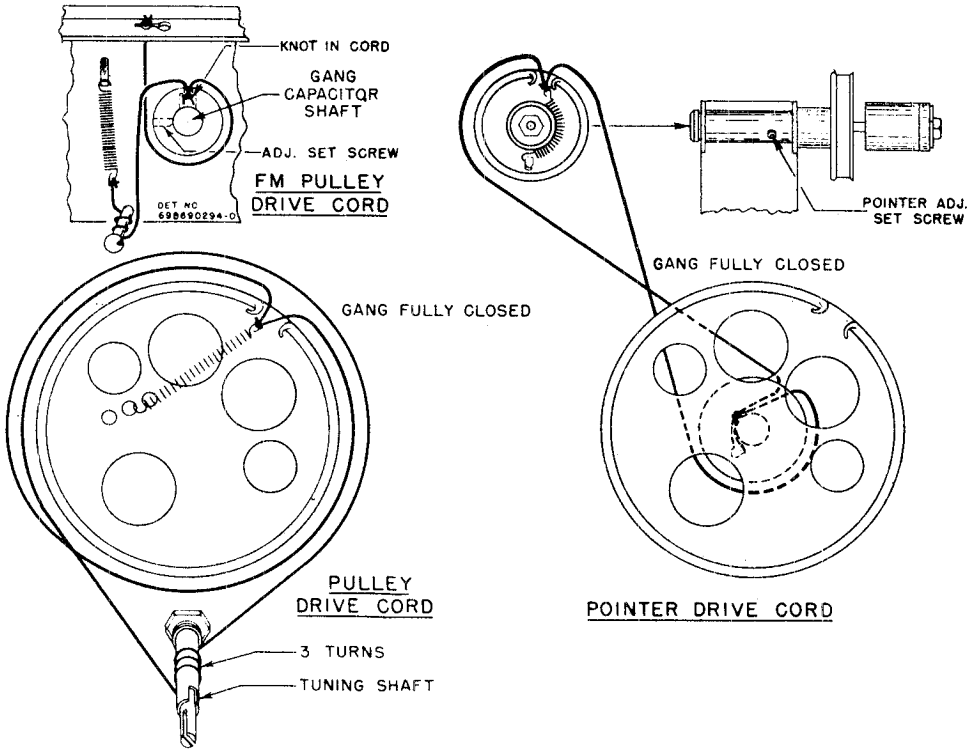


FIGURE 1. STRING DRIVE DETAIL

ALIGNMENT

Maximum performance can only be obtained if extreme care is exercised during alignment.

It is suggested that an isolation transformer be used between receiver and power line. If no isolation transformer is used and hum is encountered during alignment, connect the ground side of the signal generator output through a .1 mf capacitor to receiver chassis.

Refer to Figure 2 for location of all alignment trimmers and cores.

COMPLETE ALIGNMENT PROCEDURE USING AM SIGNAL GENERATOR

An AM (30% amplitude modulated) signal generator covering the frequencies shown in Alignment Chart I, is used to align the broadcast and FM bands. A low range output meter, connected across the speaker voice coil, is used as an output indicator.

The FM band alignment can be satisfactorily performed by following the instructions in the chart. When properly aligned, the ratio detector does not respond to amplitude modulation and since an AM type signal generator is used for aligning the FM circuits, it is necessary to detune the ratio detector transformer secondary before aligning the FM circuits. After completing the alignment of FM circuits, proceed to align the radio detector transformer secondary by applying a 10.7 Mc AM signal to the control grid (pin 7) of the FM converter tube (V-2) and adjust the ratio detector transformer secondary core for minimum audio output. No adjustment of the FM circuits should be attempted with AM after the ratio detector transformer secondary has been properly aligned.

Keep output of signal generator low so as not to overload stages and obtain false output indications. Keep receiver volume control at maximum; reduce generator output, as stages are brought into alignment, so output meter never reads more than .40 volts (.05 watts).

CHART I. ALIGNMENT PROCEDURE WHEN USING AN AM MODULATED SIGNAL GENERATOR AND STANDARD OUTPUT METER

STEP	BAND	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	TUNER SET TO	ADJUST	REMARKS
455 Kc AM IF Alignment							
1.	AM	.1 mf	12BA7 (V-2) Conv Grid Pin #7	455 Kc	Gang opened	1, 2, 3 & 4	Adjust for maximum
AM RF Alignment							
2.	AM	.1 mf	12BA7 (V-2) Conv Grid Pin #7	1620 Kc	Gang fully opened	5	Adjust for maximum
3.	AM	.1 mf	12BA7 (V-2) Conv Grid Pin #7	538 Kc	Gang fully closed	7	Adjust for maximum
4.	-	-	-	-	-	-	Repeat steps 2 & 3 several times since one adj affects the other slightly; the osc trimmer (7) should be the last adj made. Steps 2 & 3 set osc range and calibrate osc to dial scale.
5.	AM	-	Radiation loop*	1400 Kc	Tune in signal	6	Adjust for maximum
10.7 Mc FM IF Alignment							
6.	-	-	-	-	-	8	Detune ratio detector transformer secondary core by screwing core (8) out several turns.
7.	FM	.001 mf	12BA7 (V-2) Conv Grid Pin #7	10.7 Mc	Extreme high freq end	9, 10 11, 12 & 13	Adjust for maximum
FM RF Alignment							
8.	AM	-	Radiation loop*	1320 Kc	Tune in signal	-	This is for FM calibration purposes. Leave gang in this position for step 9.
9.	FM	300 ohms	12BA7 (V-2) Conv Grid Pin #7	105 Mc	Leave gang at same setting as in step 8.	14	Adjust osc core adjustment nut (14) until maximum signal output is obtained.
10.	-	-	-	-	-	15	Close gang fully and turn RF core adjustment nut (15) counterclockwise until core is at bottom of pipe, then turn nut (15) four turns clockwise.
11.	FM	300 ohms	FM Ant terminal #2 on loop back (open jumper between terminals)	90 Mc	Tune in signal	16	Adjust for maximum.
12.	FM	300 ohms	FM Ant terminal #2 on loop back (open jumper between terminals)	105 Mc	Tune in signal	15	Adjust for maximum.
13.	-	-	-	-	-	-	Repeat steps 11 & 12 until no further gain can be obtained. Make tuning plug (16) the last adjustment.
Ratio Detector Secondary Alignment							
14.	FM	.001 mf	12BA7 (V-2) Conv Grid Pin #7	10.7 Mc	High freq end	8	Adjust for minimum response between two peaks

*Connect generator output to a 5" diameter 3 turn loop and couple to receiver loop. Keep loops at least 12" apart.

SERVICE NOTES

The chassis of this receiver is connected directly to the power line. When operating the chassis (from AC line) outside of its cabinet, use an isolation transformer between power line and receiver to reduce the possibility of electrical shock. If an isolation transformer is not available, check the AC voltage between chassis and bench ground, if there is any indication of voltage, reverse line plug before handling the set.

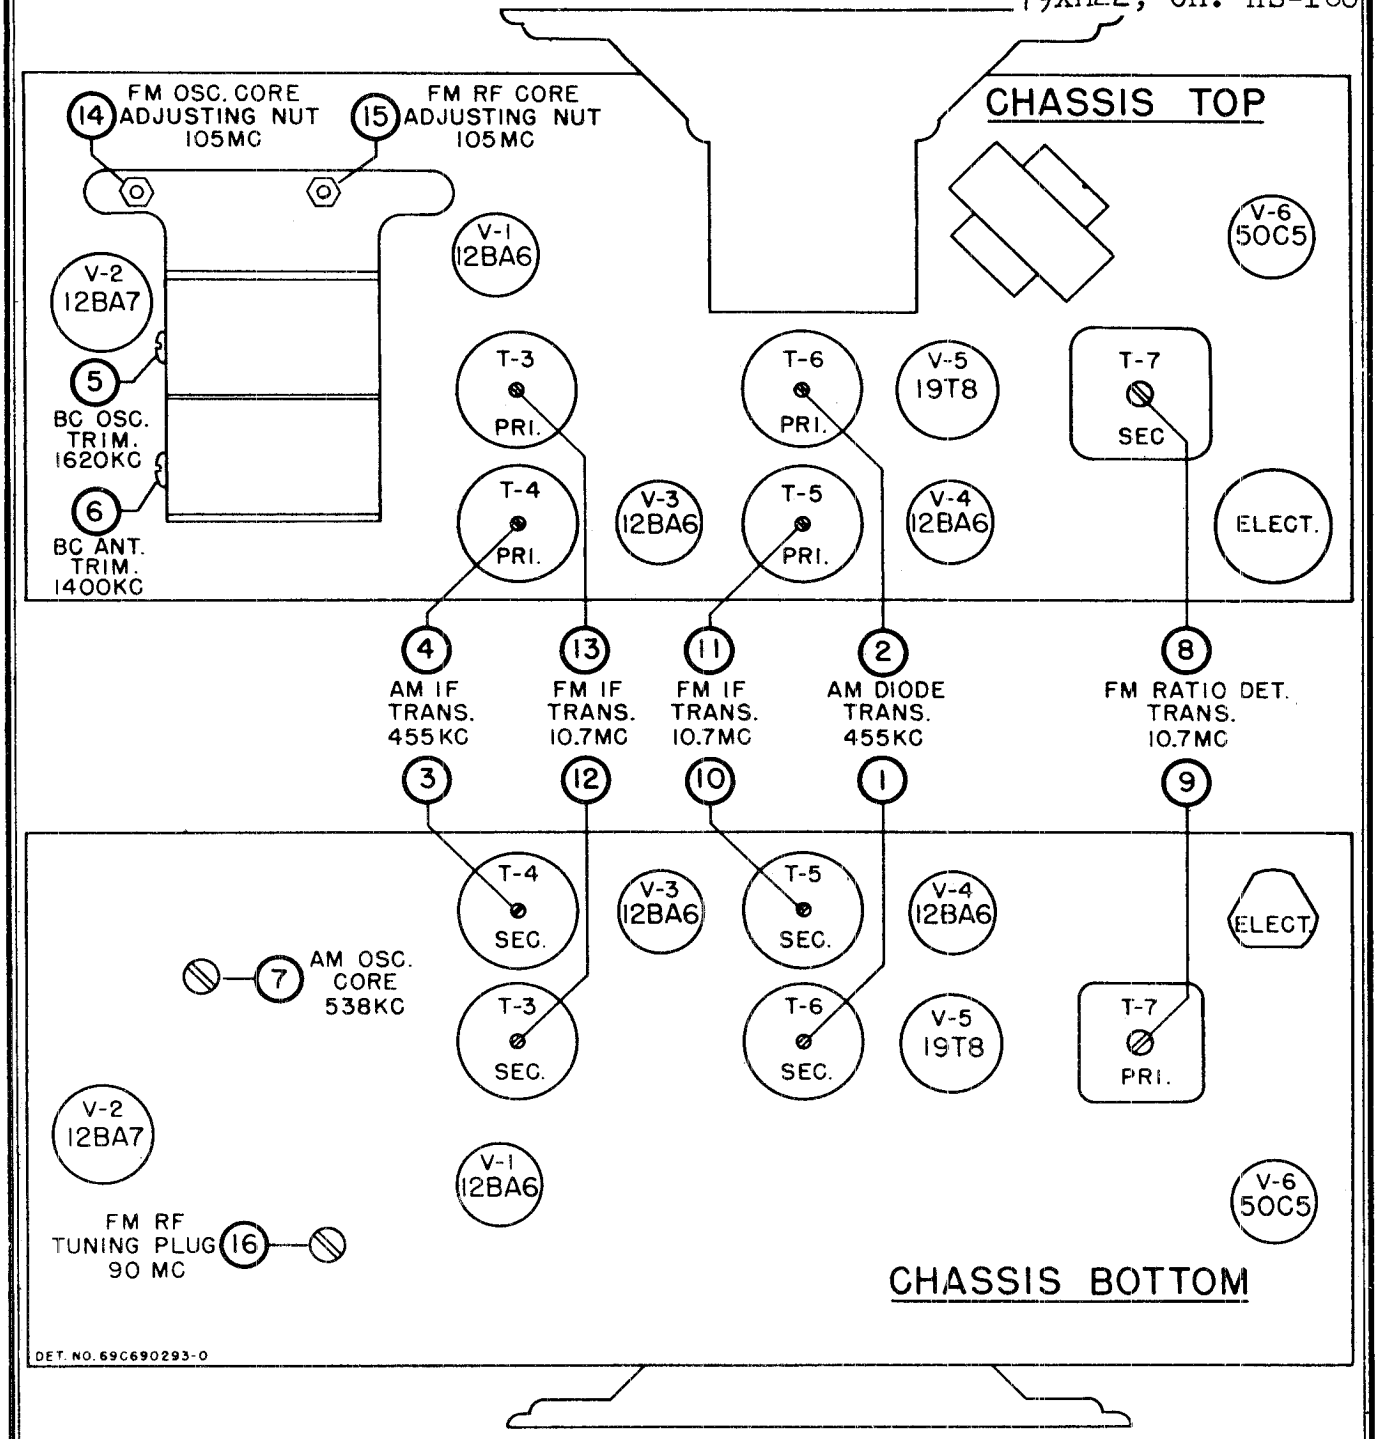

FIGURE 2. TUBE AND TRIMMER LOCATIONS

TO REMOVE CHASSIS FROM CABINET

1. Remove the pointer by setting it to either end of the dial scale and then lift the tip slightly above top of the cabinet. Now grasp the pointer tip with the fingers and screw it out of the pointer shaft (similar to removing a screw).

2. Remove the control knobs; they pull off.

3. Remove the four screws and washers that hold the back cover to the cabinet and remove the back cover.

4. Remove the two screws that hold the chassis to cabinet and slide the chassis from the cabinet.

MODELS 79XM21, 79XM22; Ch. HS-168

CHART II. FM ALIGNMENT PROCEDURE WHEN USING FM SIGNAL GENERATOR AND OSCILLOSCOPE

1. 10.7 Mc FM IF Channel Alignment (Use FM Signal Generator & Oscilloscope)

(A) Ratio Detector Alignment

1. Connect the input terminals of the oscilloscope vertical amplifier to the high side of the receiver volume control and chassis.

2. Connect the FM generator synchronizing voltage output terminals to a phase shifting network consisting of a variable 1/2 megohm resistor in series with a .002 mf capacitor. The input to the oscilloscope horizontal amplifier is connected across the .002 mf capacitor. See Figure 3. (This phase shifting network may not work with every oscilloscope. Different values of R & C may be required).

3. Apply an FM 10.7 Mc signal (200 Kc deviation) through a .001 mf capacitor to the control grid (pin 1) of the tube V-4 (12BA6) in the second FM IF amplifier stage

4. Back out ratio detector transformer secondary core (8) several turns and then adjust ratio detector transformer primary (9) for maximum amplitude. The phase shifting network resistor is adjusted to give only one trace.

5. Adjust ratio detector transformer secondary (8) until a symmetrical pattern is obtained, with peaks occurring at about 190 Kc above and below 10.7 Mc and is substantially linear between peaks. The trace should pass through the intersection of the vertical and horizontal axis. The phase shifting network should be adjusted to give only a single pattern at all times. See Figure 4. It will be necessary to go over ratio detector transformer primary (9) and secondary (8) adjustments several times before a pattern of maximum amplitude and correct symmetry is obtained.

(B) 10.7 Mc IF Alignment

1. Apply an FM 10.7 Mc signal (160 Kc deviation) to the control grid (pin 7) of tube V-3 (12BA6) in the first FM IF amplifier stage, through a .001 mf capacitor and adjust both primary and secondary cores (10 & 11) to get a symmetrical pattern as before, with peaks occurring at a slightly lower deviation.

2. Move signal generator lead from tube V-3 to control grid (pin 7) of tube V-2 (12BA7) in the converter stage, and adjust both primary and secondary cores (12 & 13) until a symmetrical pattern substantially linear between peaks is obtained.

2. RF Alignment (Use FM Signal Generator & Output Meter)

The FM signal generator may now be used to align the FM RF and oscillator channels. Merely follow steps 8 through 13, inclusive, in Chart I.

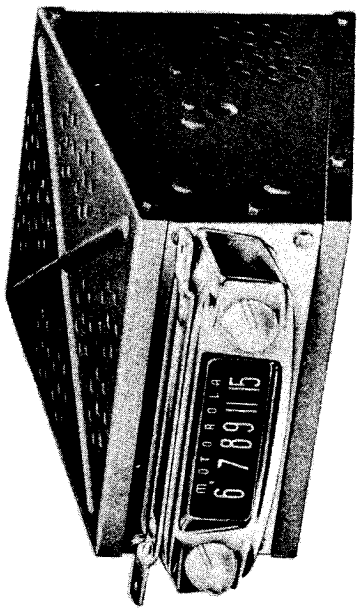
MODEL 309



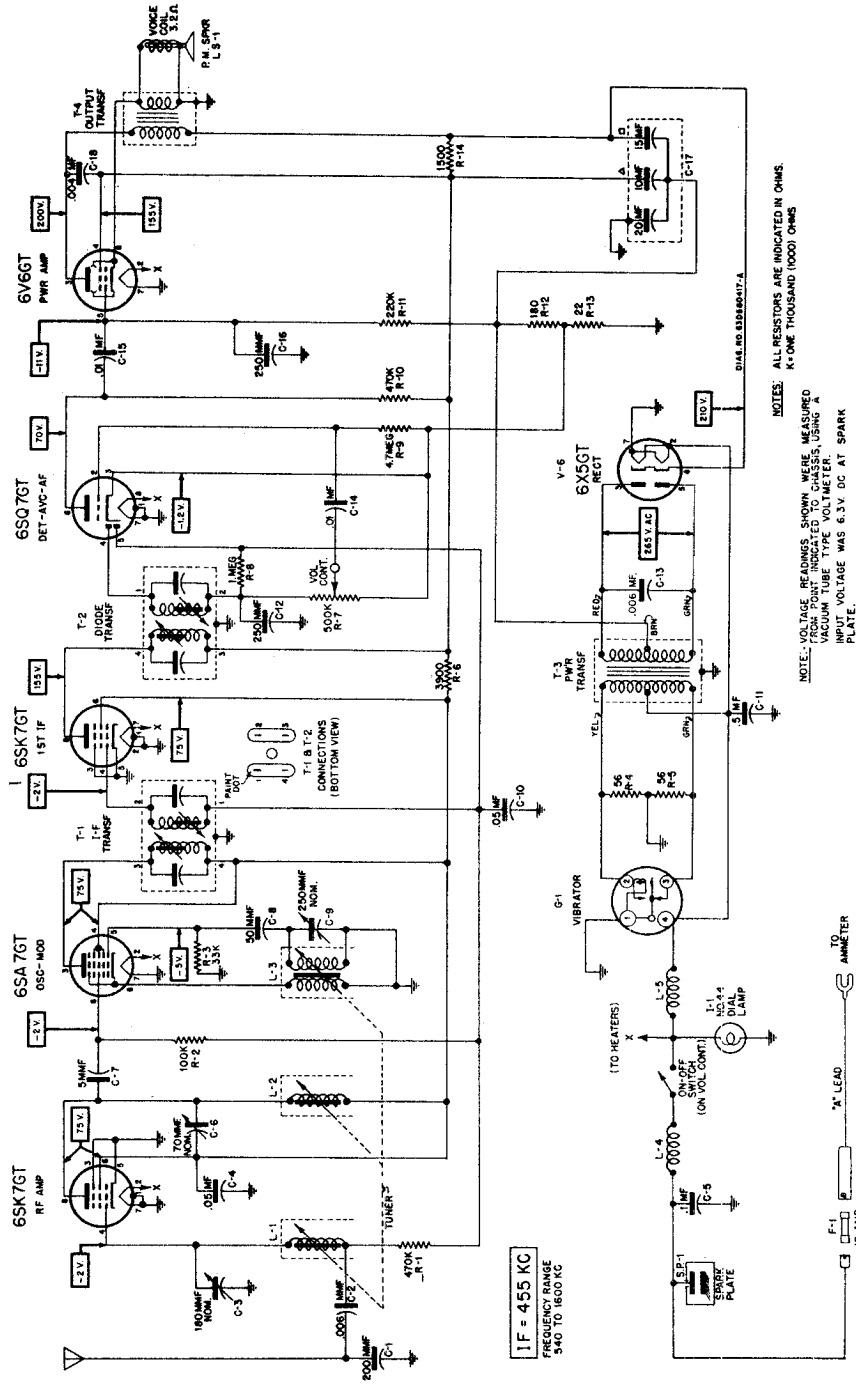
GENERAL INFORMATION

TYPE - Universal automotive type superheterodyne receiver with self-contained speaker. Designed for under-dash mounting.

TUNING RANGE - 540 to 1600 Kc IF - 455 Kc

TUBE COMPLEMENT - 6SK7GT - RF Amplifier
6SA7GT - Oscillator-Modulator
6SK7GT - IF Amplifier
6SQ7GT - Detector-AVC-AF Amplifier
6V6GT - Power Amplifier
6X5GT - Rectifier

POWER INPUT - 6.3 volts DC at 6 amperes



V-1 6SK7GT RF AMP
V-2 6SA7GT OSC-MOD
V-3 6SK7GT 1ST IF
V-4 6SQ7GT DET-AVC-AF
V-5 6V6GT PWR AMP
V-6 6X5GT RECT
T-1 I-F TRANSF
T-2 DIODE TRANSF
T-3 PWR TRANSF
T-4 OUTPUT TRANSF
T-1 & T-2 CONNECTIONS (BOTTOM VIEW)
VOICE COIL 3.2Ω
P.M. SPKR L.S-1
VOL CONT. 500K R-7
TUNER
VIBRATOR
ON-OFF SWITCH (ON VOL CONT.)
SPARE PLATE
"A" LEAD
TO AMMETER
1F = 455 KC
FREQUENCY RANGE 540 TO 1600 KC
NOTES: ALL RESISTORS ARE INDICATED IN OHMS. K = ONE THOUSAND (1000) OHMS
NOTE:- VOLTAGE READINGS SHOWN WERE MEASURED FROM TUBE SOCKET TERMINALS, USING A VACUUM TUBE TYPE VOLTMETER.
INPUT VOLTAGE WAS 6.3 V DC AT SPARK PLATE.
VOLTAGE TOLERANCE ± 10%.

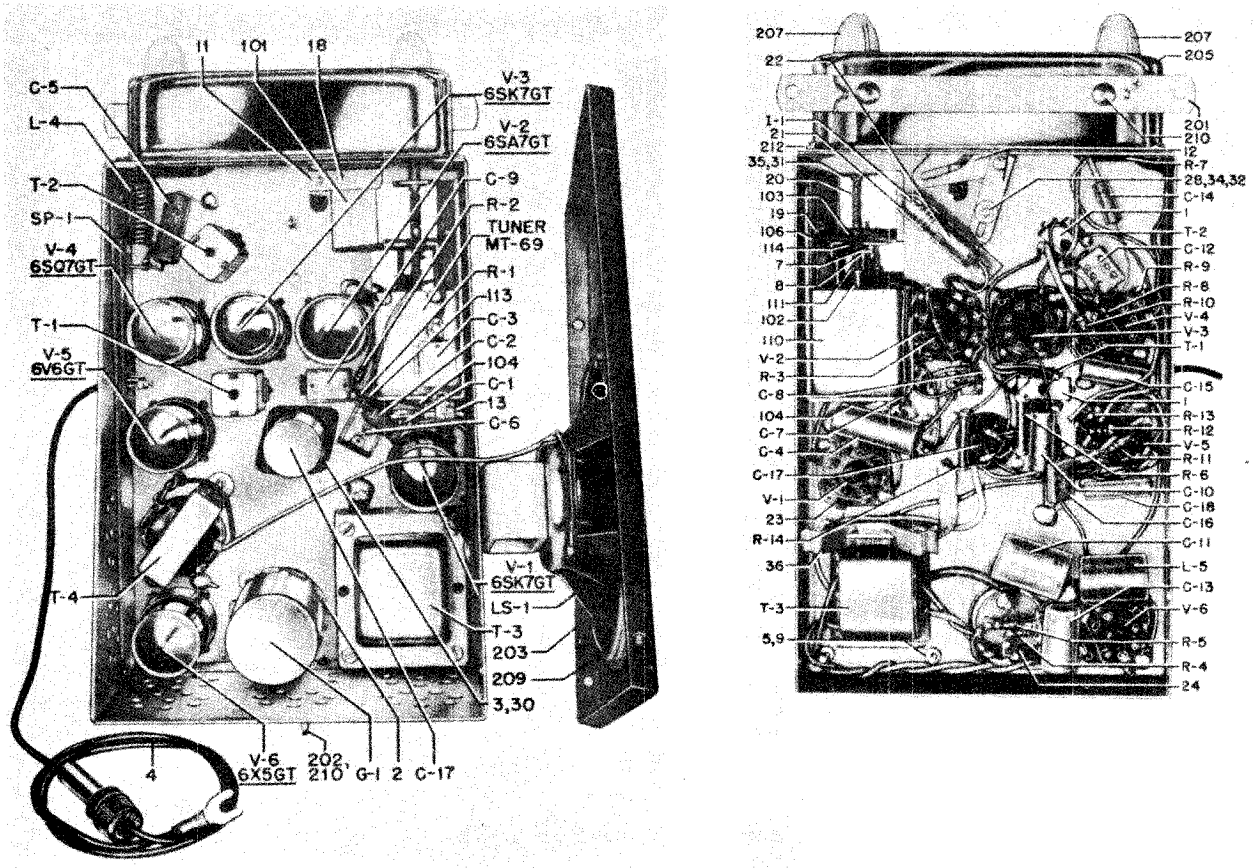

FIGURE 2. PARTS LOCATIONS

ALIGNMENT

Connect a low range output meter across speaker voice coil and set volume control at maximum. For greatest accuracy, keep output of receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing signal generator output as stages are brought into alignment. Use a small fibre screwdriver when aligning IF and diode transformers. A special tool, Motorola Part No. 66A76278, is required for adjusting the tuner cores. IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores; the slightest inward pressure may move tuner carriage and result in inaccurate alignment. Remove receiver top and bottom covers and the escutcheon and dial scale assembly to expose all adjustments.

STEP	DUMMY ANTENNA	GENERATOR CONNECTION	GENERATOR FREQUENCY	TUNER SET TO	ADJUST	REMARKS
IF ALIGNMENT						
1.	.1 mf	6SA7 Grid (pin #8)	455 Kc	High frequency end (cores out)	1, 2 3 & 4	Peak for maximum in order indicated. Check by repeating procedure.
RF ALIGNMENT						
2.	See Fig. 3	Antenna receptacle through dummy.	1605 Kc	High frequency end; cores should project 1-1/4" from cans. (Screw out)	5, 6 & 7	Peak for maximum in order indicated.
3.	"	"	1300 Kc	1300 Kc per Fig. 4	8, 9 & 10	"
POINTER ADJUSTMENT						
4.	"	"	600 Kc	Tune for maximum.	-	Replace dial scale & set pointer to 600 Kc by means of pointer adjustment screw.

5. With receiver installed in car, the antenna fully extended and dial set to approximately 1400 Kc, adjust antenna trimmer (7) for maximum volume of a weak station or noise between stations.

EQUIPMENT REQUIRED

ALIGNMENT

1. A special tool for adjusting the tuner cores. Use Alignment Tool, Motorola Part No. 66A76278.
2. A small screwdriver for IF & RF alignment.
3. An accurately calibrated AM modulated signal generator.
4. A low range output meter.
5. A special dummy antenna for RF alignment. Construct dummy antenna as shown in Figure 1. The 21" coaxial lead needed in its construction is the same type as used for lead-in on Motorola car antennas.

PROCEDURE

1. Remove the front and rear housings. All adjustments are now exposed.
2. Connect a PM speaker (3.2 ohm VC) to VC and GND. terminals and connect the output meter across the voice coil.

31A472573	Strip, terminal: 2 insulated lugs, #2 mtg .....
31K16330	Strip, terminal: 3 insulated lugs, #3 mtg .....

HOUSING PARTS

42A472033	Clip, chassis retainer ....
13D580531	Escutcheon, complete .....
1X580832	Housing and Bushing Assembly, rear .....
15K580526	Housing, front: less escutcheon
3S7454	Screw, sheet metal: #8 x 1/4 PKZ plain hex head; cad pl, (escutcheon mounting) ....

9. ANTENNA TRIMMER ADJUSTMENT. Once steps 7A, B, C, D & 8 have been satisfactorily performed, no further adjustment of any alignment screws should be made except to align the antenna trimmer (7) to car antenna after receiver is installed in car. This adjustment should be made with antenna fully extended and receiver set to approximately 1400 Kc. Peak the trimmer for maximum volume of a weak station or background noise between stations.

3. Connect a 6 volt storage battery to GND. and BAT. terminals of receiver; turn receiver on and allow it to warm up for a few minutes. Set receiver volume control at maximum.

4. Sensitivity Control. This control must be set to provide 2 ± 1/2 volts bias on the RF tubes before alignment is started. Measure this voltage between sensitivity control terminal and chassis.

5. For greatest accuracy, keep output of receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.

6. IF ALIGNMENT

A. Connect high side of signal generator through .1 mf capacitor to 6BE6 grid (pin #7) and the low side to chassis. Set generator to 455 Kc and peak adjustments (1, 2, 3 & 4), in this order, for maximum output.

B. Check alignment by repeating procedure.

7. RF ALIGNMENT

A. Connect signal generator to antenna receptacle through special dummy antenna (60 mmf capacitor in series with 21" coax lead).

B. Move carriage plate (by turning manual tuning shaft) to extreme high frequency position and screw coil cores out so that at least 1-1/8" of all three cores shall be outside of the coil shield can. Set signal generator to 1605 Kc and peak trimmers (5, 6 and 7), in this order.

C. Move the carriage plate (by turning manual tuning shaft) so carriage plate is spaced exactly 1-5/64" from coil shield plate. Set signal generator to 1425 Kc and adjust coil cores (8, 9 & 10), in this order, for maximum output.

D. Move carriage plate (by turning manual tuning shaft) so carriage plate is spaced approximately 7/32" from coil shield plate. Leave signal generator connected but turn signal generator power off. Peak oscillator padder core (11) for maximum noise. If the padder core must be moved more than 1/2 turn from its original position, the carriage plate should be moved to extreme high frequency position, the coil cores (8, 9 & 10) should be screwed out so that 1-1/8" of each core is exposed and steps 7A, B, C & D repeated until it is necessary to move the padder core less than 1/2 turn in this step.

IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores. The slightest inward pressure on the alignment tool may move the tuner carriage and result in inaccurate alignment.

8. SETTING THE SENSITIVITY CONTROL. After alignment is completed, set signal generator to 600 Kc and adjust its output to 1.3 microvolts. Adjust the sensitivity control to provide 1 watt output (1 watt = 1.79 volts on output meter).

REPLACEMENT PARTS LIST

REF. NO.	PART NO.	DESCRIPTION
CHASSIS PARTS - ELECTRICAL		
CAPACITORS		
C-1	21B77562	Ceramic: 100 mmf 500V .....

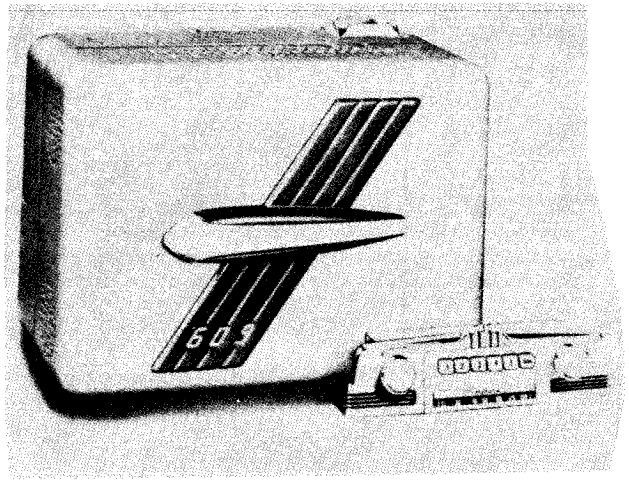
ALIGNMENT

EQUIPMENT REQUIRED

1. A special tool for adjusting the tuner cores. Use Alignment Tool, Motorola Part No. 66A76278.
2. A small screwdriver for IF & RF alignment.
3. An accurately calibrated AM modulated signal generator.
4. A low range output meter.
5. A special dummy antenna for RF alignment. Construct dummy antenna as shown in Figure 1. The 21" coaxial lead needed in its construction is the same type as used for lead-in on Motorola car antennas.



PROCEDURE

1. Remove the front and rear housings. Also remove the shield from the tuner. All adjustments are now exposed.
2. Connect a PM speaker (3.2 ohm VC) to VC and GND. terminals and connect the output meter across the voice coil

3. Connect a 6 volt storage battery to chassis and BATT. terminal of receiver; turn receiver on and allow it to warm up for a few minutes. Press control head 'M' button to place tuner in manual position. (If a control head is not available, move tuner carriage plate by hand till tuner is in manual position). Set receiver volume control at maximum and tone control to treble (high) position.
4. Sensitivity Control. This control must be set to provide 2 ± 1/2 volts bias on the RF tubes before alignment is started. Measure this voltage between sensitivity control terminal and chassis.
5. For greatest accuracy, keep output of receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.
6. IF ALIGNMENT
   A. Connect high side of signal generator through .1 mf capacitor to 6BE6 grid (pin #7) and the low side to chassis. Set generator to 455 Kc and peak adjustments (1, 2, 3 & 4), in this order, for maximum output.
   B. Check alignment by repeating procedure.
7. RF ALIGNMENT
   A. Connect signal generator to antenna receptacle through special dummy antenna (60 mmf capacitor in series with 21" coax lead).
   B. Move carriage plate (by turning manual tuning shaft) to extreme high frequency position and screw coil cores out so that at least 1-1/8" of all three cores shall be outside of the coil shield can. Set signal generator to 1605 Kc and peak trimmers (5, 6 and 7), in this order.
   C. Move the carriage plate (by turning manual tuning shaft) so carriage plate is spaced exactly 1-43/64" from coil shield plate. Set signal generator to 1425 Kc and adjust coil cores (8, 9 & 10) in this order, for maximum output.
   D. Move carriage plate (by turning manual tuning shaft) so carriage plate is spaced approximately 27/32" from coil shield plate. Leave signal generator connected but turn signal generator power off. Peak oscillator padder core (11) for maximum noise. If the padder core must be moved more than 1/2 turn from its original position, the carriage plate should be moved to extreme high frequency position, the coil cores (8, 9 & 10) should be screwed out so that 1-1/8" of each core is exposed and steps 7A, B, C & D repeated until it is necessary to move the padder core less than 1/2 turn in this step.
   IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores. The slightest inward pressure on the alignment tool may move the tuner carriage and result in inaccurate alignment.
8. SETTING THE SENSITIVITY CONTROL. After alignment is completed, set signal generator to 600 Kc and adjust its output to 1.3 microvolts. Adjust the sensitivity control to provide 1 watt output (1 watt = 1.79 volts on output meter).
9. ANTENNA TRIMMER ADJUSTMENT. Once steps 7A, B, C, D & 8 have been satisfactorily performed, no further adjustment of any alignment screws should be made except to align the antenna trimmer (7) to car antenna after receiver is installed in car. This adjustment should be made with antenna fully extended and receiver set to approximately 1400 Kc. Peak the trimmer for maximum volume of a weak station or background noise between stations.

ALIGNMENT

EQUIPMENT REQUIRED

1. A special tool for adjusting the tuner cores. Use Alignment Tool, Motorola Part No. 66A76278.
2. A small screwdriver for IF & RF alignment.
3. An accurately calibrated AM modulated signal generator.
4. A low range output meter.
5. A special dummy antenna for RF alignment. Construct dummy antenna as shown in Figure 1. The 21" coaxial lead needed in its construction is the same type as used for lead-in on Motorola car antennas.

PROCEDURE

1. Remove the front and rear housings. Also remove the shield from the tuner. All adjustments are now exposed.
2. Connect a PM speaker (3.2 ohm VC) to VC and GND. terminals and connect the output meter across the voice coil.
3. Connect a 6 volt storage battery to chassis and BATT. terminal of receiver; turn receiver on and allow it to warm up for a few minutes. Press control head 'M' button to place tuner in manual position. (If a control head is not available, move tuner carriage plate by hand till tuner is in manual position). Set receiver volume control at maximum and tone control to treble (high) position.
4. Sensitivity Control. This control must be set to provide 2 ± 1/2 volts bias on the RF tubes before alignment is started. Measure this voltage between sensitivity control terminal and chassis.
5. For greatest accuracy, keep output of receiver at approximately 1 watt (1 watt = 1.79 volts on output meter) throughout alignment by reducing generator output (not receiver volume control) as stages are brought into alignment.
6. IF ALIGNMENT
   A. Connect high side of signal generator through .1 mf capacitor to 6BE6 grid (pin #7) and the low side to chassis. Set generator to 455 Kc and peak adjustments (1, 2, 3 & 4), in this order, for maximum output.
   B. Check alignment by repeating procedure.
7. RF ALIGNMENT
   A. Connect signal generator to antenna receptacle through special dummy antenna (60 mmf capacitor in series with 21" coax lead.)
   B. Move carriage plate (by turning manual tuning shaft) to extreme high frequency position and screw coil cores out so that at least 1-1/8" of all three cores shall be outside of the coil shield can. Set signal generator to 1605 Kc and peak trimmers (5, 6 and 7), in this order.
   C. Move the carriage plate (by turning manual tuning shaft) so carriage plate is spaced exactly 1-43/64" from coil shield plate. Set signal generator to 1425 Kc and adjust coil cores (8, 9 & 10), in this order, for maximum output.
   D. Move carriage plate (by turning manual tuning shaft) so carriage plate is spaced approximately 27/32" from coil shield plate. Leave signal generator connected but turn signal generator power off. Peak oscillator padder core (11) for maximum noise. If the padder core must be moved more than 1/2 turn from its original position, the carriage plate should be moved to extreme high frequency position, the coil cores (8, 9 & 10) should be screwed out so that 1-1/8" of each core is exposed and steps 7A, B, C & D repeated until it is necessary to move the padder core less than 1/2 turn in this step.
   IMPORTANT: Do not push in on the alignment tool when adjusting the tuner cores. The slightest inward pressure on the alignment tool may move the tuner carriage and result in inaccurate alignment.
8. SETTING THE SENSITIVITY CONTROL. After alignment is completed, set signal generator to 600 Kc and adjust its output to 1.3 microvolts. Adjust the sensitivity control to provide 1 watt output (1 watt = 1.79 volts on output meter).
9. ANTENNA TRIMMER ADJUSTMENT. Once steps 7A, B, C, D & 8 have been satisfactorily performed, no further adjustment of any alignment screws should be made except to align the antenna trimmer (7) to car antenna after receiver is installed in car. This adjustment should be made with antenna fully extended and receiver set to approximately 1400 Kc. Peak the trimmer for maximum volume of a weak station or background noise between stations.

Circuit Changes

The following changes have been made in the circuit of Chassis RE-252 since the original service bulletin was printed:

1. Resistor R3 is connected from the grid of the 12SA7 tube to chassis. On the schematic diagram of the original bulletin, this was shown connected from the grid to A. V. C.
2. The Electrolytic Condenser C12, Part No. A22015, has been changed from 40-20 mfd., 150 V., 20 mfd., 25 V., to 50-30 mfd., 150 V., 20 mfd., 25 V. Some sets were built with a 20 mfd., 150 V. condenser connected across the B section of the original condenser. When excessive hum or hum modulation is encountered on sets which have the original 40-20 mfd., 150 V., 20 mfd., 25 V. condenser, adding the extra 20 mfd., 150. condenser across the B section will usually correct it.
3. The RF Plate Resistor R2 is changed from ¼ Watt, C20060-472 to 1 Watt, C20103-472.
4. The two diodes in the 12SQ7 tube, socket lugs 4 and 5, are tied together; lug No. 4 was originally connected to A. V. C.
5. The RF tube was changed from 12SK7 to 12SG7 to increase the gain.

MODELS 253T, 254T,
255T, 256T; Ch. RE-252

ALIGNMENT PROCEDURE

A. Connect to 117 V., AC line and turn set on with volume control at full volume.

B. Connect signal generator high side through .05 uf or larger condenser to 12SA7 grid. Connect low side of signal generator to Chassis. Connect output meter across speaker voice coil.

C. Open variable condenser.

D. With signal generator set at 455 Kc, increase output of generator until output is heard in speaker. Adjust IF trimmers until maximum output meter reading is obtained, reducing signal generator output as adjustment progresses so that final adjustment is made with lowest input consistent with good signal to noise ratio.

E. With signal generator connected to a radiating loop and set to 1620 Kc, adjust oscillator trimmer (C11B) on variable condenser until output is maximum. Variable Condenser is to be fully opened during this adjustment.

F. Set signal generator to 1400 Kc and rotate variable condenser until output is maximum. Adjust R. F. trimmer (C11A) on variable, condenser until output increases to a new maximum. Rotate variable condenser slightly to obtain another maximum output. Re-adjust trimmers until output is again a maximum. Repeat this cycle until no further increase in output can be obtained. Final adjustment to be made with a signal generator output at lowest level consistent with good signal to noise ratio.

G. Set signal generator to 1000 Kc and tune radio to maximum output. Adiust variable condenser plates for maximum output.

H. Set signal generator to 600 Kc and proceed as in G above.

I. Set signal generator to 540 Kc and make sure that radio will tune to maximum output slightly before variable condenser is fully closed.

J. Recheck alignment and calibration at 1400, 1000, and 600 Kc, making any necessary readjustments.

K. Tune the variable condenser through its entire range to make sure it is not shorted at any point.

HOW TO ORDER PARTS

Replacement parts should be ordered by Arvin part number, description and model number of receiver from your Arvin Distributor. The Distributor will order direct from the factory, except in the case of tubes, which should be obtained through regular tube distribution channels.

MODEL 341T,
Ch. RE-274

ALIGNMENT PROCEDURE

PRELIMINARY:

Output meter connection	Across loudspeaker voice coil
Output meter reading to indicate 200 milliwatts (standard output)	0.8 volts
Dummy antenna to be in series with signal generator output	See chart below
Connection of generator ground lead	Floating ground
Generator modulation	30% 400 cycles
Position of Volume Control	Fully clockwise
Position of pointer with variable fully closed	54 on dial

Position of Variable	Generator Frequency	Dummy Antenna	Generator Output Connection	Trimmers Adjuster	Trimmer Function	Approximate Sensitivity
Open	455 Kc	.05 uf	12SA7 Grid (Stator of C-1)	2 trimmers on top of T-3	IF	3000 uv
1400 Kc	1400 Kc	.00005 uf	Antenna lug with Ant. Removed	**C-2	Oscillator	360 uv

**Since the antenna section of the variable has no trimmer, the rotor of the variable should be rocked back and forth on both sides of 1400 Kc while adjusting the oscillator trimmer for maximum output. This is to obtain the combination of rotor and trimmer setting to give perfect tracking of the two sections of the variable condenser and consequently give maximum output.

Check sensitivity at 600 Kc. If weak, adjust antenna section plates for maximum output at 600 Kc. Tracking of the condenser at points other than 1400 Kc is accomplished by bending the outside plates on the variable condenser rotor, which are cut for this purpose. When bending plates to track the condenser at any given frequency, keep in mind the fact that this will affect the tracking at all frequencies below the point where the plates are bent. A tuning wand is very helpful in checking the tracking of this condenser, to indicate whether more or less capacity is needed.

The alignment procedure should be repeated stage by stage in the original order for greatest accuracy.

Always keep the output from the test oscillator at its lowest possible value to make the AVC action of the receiver ineffective.

ALIGNMENT PROCEDURE

A. Connect to 117 V. AC line and turn set on with volume control at full volume.

B. Connect output meter across speaker voice coil. (Output meter reading to indicate 50 MW, standard output is .4 volt).

C. With variable condenser closed set pointer to end mark, (bottom hole) on dial back.

D. Connect signal generator high side through .05 uf or larger condenser to high side of loop or variable condenser. Connect signal generator low side to floating ground of the receiver.

E. Open variable condenser.

F. With signal generator set at 455 Kc., increase output of generator until output is heard in speaker. Adjust I. F. trimmers A1, A2, A3 and A4 until maximum output meter reading is obtained, reducing signal generator output as adjustment progresses so that final adjustment is made with lowest input consistent with good signal to noise ratio. NOTE: If no signal can be heard with signal generator connected at at D above, connect high side to terminal 6 of 1R5 tube, through condenser as at D, and proceed as before.

G. With signal generator at 455 Kc and connected as in D above, adjust R. F. transformer coupling condenser A5 until output meter reading is a minimum. Final adjustment is to be made with high signal input so that an accurate adjustment can be made.

H. With signal generator connected to radiating loop and set to 1620 Kc adjust oscillator trimmer A6 on variable condenser until output is maximum. Variable condenser is to be fully opened during this adjustment.

I. Set signal generator to 1400 Kc and rotate variable condenser until output is maximum. Adjust R. F. trimmer A7 on variable condenser until output increases to a new maximum. Rotate variable condenser slightly to obtain another maximum output. Re-adjust trimmer until output is again a maximum. Repeat this cycle until no further increase in output can be obtained.

NOTE: When adjusting A7 R. F. Trimmer, make sure the set loop is the same distance from and in the same position with respect to the chassis and batteries as it would be when the set is mounted in the cabinet with the back closed.

J. The alignment procedure should be repeated in the original order for greatest accuracy. Always keep the output from the signal generator at its lowest possible value to make the AVC action of the receiver ineffecctive.
The sensitivity of this set should be approximately 180 uv/meter with 400 cycle 30% modulation and 50 milliwatt (.4 volt) output.

MODELS 350-UP, 351-UP;
Ch. RE 267,

SUBJECT: Circuit and Model Number Changes.

Change covered in this supplement.

1. Circuit change to reduce hum, prevent oscillation and improve reception.
2. Model number changes (350-UP and 351-UP) to comply with Underwriters' Lab requirements.

The following changes were made in production and can be used as repair measures on sets of earlier production now in the field.

Hum Reduction.

The 100 mfd. 10 V. section of the Electrolytic Condenser was changed from the end of the 3V4 filament (Pin #1) to the center tap of the 3V4 filament (Pin #5) and a .5 mfd, 200 V. Condenser (Part #A22388) was added across the 1850 ohm metal clad 10 watt Resistor, R9. This Resistor is mounted on the front chassis flange.

To make this change in the field, remove the two yellow wires from the 100 mfd. 10V. lug on the Electrolytic Condenser (C18C). Connect these two wires together, placing the joint so that it can not touch anything. Then connect a piece of wire from this condenser lug to #5 pin of the 3V4 socket. Connect .5 mfd. 200 V. Condenser (Part #A22338, chosen for its small size due to space limitations) to the two lugs on the metal clad resistor.

Oscillation Prevention.

The AVC characteristics were modified to prevent oscillation and improve reception, by adding a 100,000 ohm, 1/3 watt Resistor, R18 (Part #C20271-104) connected from Pin #1 of 1U4 R.F. amplifier to the lug on the variable condenser mounting screw (AVC).

Model Number Changes.

A 22 ohm fusing resistor was added in series in the high side of the AC line to the Selenium Rectifier, to comply with Underwriters' Lab. requirements. All sets having this change will be designated as Model 350-UP or 351-UP.

Precautions which should be taken to prevent excessive hum and audio feed back.
